Remark 0.1 (Passage from reduced to unreduced). Suppose that we are given an unreduced homology theory E . Let X pointed CW -complex. Note that

$$* \rightarrow X \rightarrow *$$

is the identity. This implies that the long exact sequence

$$\dots \rightarrow E_{q+1}(X, *) \rightarrow E_q(*) \rightarrow E_q(X) \rightarrow E_q(X, *) \rightarrow E_{q-1}(*) \rightarrow \dots$$

splits into split short exact sequences

$$0 \rightarrow E_q(*) \rightarrow E_q(X) \rightarrow E_q(X, *) \rightarrow 0$$

so that

$$E_*(X) \cong E_*(X, *) \oplus E_*(*) .$$

Then, the functor

$$\tilde{E}_*(X) = E_*(X, *)$$

gives a reduced homology theory.

Conversely, given a reduced homology theory \tilde{E}_* and a CW-pair (X, A) . Then letting

$$E_*(X, A) = \tilde{E}_*(X_+/A_+).$$

In particular,

$$E_*(X) = E_*(X, \emptyset) = \tilde{E}_*(X_+/\emptyset_+) = \tilde{E}_*(X_+).$$

This will give an unreduced homology theory.

Note that nothing in this remark appealed to the dimension axiom.

Theorem 0.2. *The following data is equivalent:*

- (1) $E_* : \text{Toppairs} \rightarrow \text{Ab}$
- (2) $E_* : \text{CWpairs} \rightarrow \text{Ab}$
- (3) $\tilde{E}_* : \text{CWTop}_* \rightarrow \text{Ab}$
- (4) $\tilde{E}_* : \text{Top}_* \rightarrow \text{Ab}$

The same holds for cohomology.

1. UNIQUENESS

Definition 1.1. An isomorphism $\alpha : \tilde{E}_* \rightarrow \tilde{E}'_*$ of reduced cohomology theories is a natural isomorphism that commutes with the suspension isomorphisms, i.e.,

$$\begin{array}{ccc} \tilde{E}_n(X) & \xrightarrow{\alpha_X} & \tilde{E}'_n(\Sigma X) \\ \Sigma \downarrow & & \downarrow \Sigma \\ \tilde{E}_{n+1}(\Sigma X) & \xrightarrow{\alpha_{\Sigma X}} & \tilde{E}'_{n+1}(\Sigma X). \end{array}$$

In this section, we are going to assume what Katharyn and Andy proved last class and prove the uniqueness of \tilde{H} .

Theorem 1.2. *Let \tilde{E} be a reduced cohomology theory such that $\tilde{E}_*(S^0) = \mathbb{Z}$, then $\tilde{E} \cong \tilde{H}$.*

Note that this also holds for coefficients other than \mathbb{Z} . Again, this is exactly the argument in *Concise*.

Proof. Assume $\tilde{E} : \text{CWTop}_* \rightarrow \text{Ab}$ is a homology theory that satisfies the dimension axiom.

We will assume the following fact and prove it later.

Theorem 1.3. *Let E be any generalized homology theory. Let $X = \bigcup_{i=1}^{\infty} X_i$ where $X_0 \subset X_1 \subset X_2 \subset \dots$. Then $E_*(X) = \text{colim } E_*(X_i)$.*

As Katharyn and Andy showed, this implies that,

- $\tilde{E}_n(X) = \tilde{E}_n(X^{n+1})$ for any X .
- $\pi_n^{ab}(\bigvee S^n) \xrightarrow{h} \tilde{E}_n(\bigvee S^n)$ is an isomorphism.

We use \tilde{E} to define the cellular chain complex. Let $\tilde{C}_n^E(X) = \tilde{E}_n(X^n/X^{n-1})$. Then $\tilde{C}_n^E(X) \cong \pi_n^{ab}(X^n/X^{n-1})$. So, as abelian groups

$$\tilde{C}_n^E(X) \cong \tilde{C}_n^{CW}(X).$$

Define $d_n : \tilde{C}_n^E(X) \rightarrow \tilde{C}_{n-1}^E(X)$ by $\Sigma^{-1} \circ \tilde{E}_n(\partial_n)$ where

$$\partial_n : X^n/X^{n-1} \xrightarrow{\cong} C_i \rightarrow \Sigma X^{n-1} \rightarrow \Sigma X^{n-1}/X^{n-2}.$$

Note that $\tilde{E}_n(\partial_n) = \partial$ is the connecting homomorphism in the long exact sequence

$$\dots \rightarrow \tilde{E}_n(X^n/X^{n-1}) \xrightarrow{\partial} \tilde{E}_{n-1}(X^{n-1}) \rightarrow \tilde{E}_{n-1}(X^n) \rightarrow \tilde{E}_{n-1}(X^n/X^{n-1}) \rightarrow \dots$$

Now, since h is natural and commutes with Σ , we have a commutative diagram:

$$\begin{array}{ccccc} \pi_n^{ab}(X^n/X^{n-1}) & \xrightarrow{\pi_n \partial_n} & \pi_n^{ab}(\Sigma X^{n-1}/X^{n-2}) & \xrightarrow{\Sigma^{-1}} & \pi_{n-1}^{ab}(X^{n-1}/X^{n-2}) \\ \downarrow h & & \downarrow h & & \downarrow h \\ \tilde{E}_n(X^n/X^{n-1}) & \xrightarrow{\tilde{E}_n(\partial_n)} & \tilde{E}_n(\Sigma X^{n-1}/X^{n-2}) & \xrightarrow{\Sigma^{-1}} & \tilde{E}_{n-1}(X^{n-1}/X^{n-2}). \end{array}$$

The top row is the differential of $C_n^{CW}(X)$. This shows that there is an isomorphism of chain complexes

$$C_*^E(X) \cong C_*^{CW}(X).$$

We construct a natural isomorphism

$$\alpha : \tilde{E}_n(X) \rightarrow \ker(d_n)/\text{im}(d_{n+1}) = \tilde{H}_n(X)$$

using the diagram, which is based on the fact that we know the homology of a wedge of spheres. Here, we use the following fact.

Lemma 1.4. $\tilde{E}_n(Y) = 0$ if Y is a CW complex of dimension $\leq n$ and $n+1 \leq m$.

Proof. If Y has dimension 0, then it is a set of points and this follows from the dimension axiom. If Y has dimension n , then consider the exact sequence:

$$\tilde{E}_m(Y^{n-1}) \rightarrow \tilde{E}_m(Y) \rightarrow \tilde{E}_m(Y/Y^{n-1}) = \tilde{E}_m(\bigvee D^n/\partial D^n)$$

The claim holds for Y^{n-1} by the induction hypothesis and for a wedge of spheres by the dimension axiom and the suspension isomorphism. Hence, it holds for Y . \square

This lemma implies that $\tilde{E}_{n+1}(X^n/X^{n-1}) = 0$. We then have the following commutative diagram, where the columns are pieces of the long exact sequences for $X^k \subset X^{k+1}$.

$$\begin{array}{ccccccc}
 \tilde{C}_{n+1}^{CW}(X) & \equiv & \tilde{E}_{n+1}(X^{n+1}/X^n) & & 0 & & \\
 & & \downarrow \partial & \searrow d_{n+1} & \downarrow & & \\
 0 & \longrightarrow & \tilde{E}_n(X^n) & \xrightarrow{\pi_*^n} & \tilde{E}_n(X^n/X^{n-1}) & \xrightarrow{\partial} & \tilde{E}_{n-1}(X^{n-1}) \\
 & & \downarrow i_* & \nearrow \alpha & \parallel & \searrow d_n & \downarrow \pi_*^{n-1} \\
 \tilde{E}_n(X) & \equiv & \tilde{E}_n(X^{n+1}) & & \tilde{C}_n^{CW}(X) & & \tilde{E}_{n-1}(X^{n-1}/X^{n-2}) \equiv \tilde{C}_{n-1}^{CW}(X) \\
 & & \downarrow & & & & \\
 & & 0 & & & &
 \end{array}$$

Definition. For any y such that $i_*(y) = x$, let

$$\alpha(x) = \pi_*(y).$$

Well-defined. First, note that

$$d_n(\alpha(x)) = \pi_*^{n-1} \partial(\pi_*^n(y)) = 0$$

since $\partial \circ \pi_*^n = 0$. So $\alpha(x) \in \ker(d_n)$. Now, if $i_*(y') = x$, we have $i_*(y - y') = 0$, so that

$$y - y' = \partial(z).$$

Hence,

$$\pi_*^n(y - y') = \pi_*^n \partial(z) = d_{n+1}(z).$$

Hence, $y \equiv y' \pmod{\text{im } d_{n+1}}$. So, α is well-defined.

Injective. If $\alpha(x) = 0$, then $\pi_*^n(y) = 0$, but π_*^n is injective, so $y = 0$. Hence, $0 = i_*(y) = x$.

Surjective. Let $a \in \ker(d_n)$. Then, $a \in \ker \partial$ since π_*^{n-1} is injective. That means that $a = \pi_*^n y$. Then $\alpha(i_*(y)) = a$.

Naturality. All maps in the diagram are natural, hence so is α . Suspension is a natural isomorphism of chain complexes

$$\tilde{C}_n^{CW}(X) = \pi_n^{ab}(X^n/X^{n+1}) \xrightarrow{\cong} \pi_{n+1}^{ab}(\Sigma X^n/X^{n+1}) \cong \tilde{C}_{n+1}^{CW}(\Sigma X)$$

and everything in the above diagram commutes with the suspension isomorphism. Therefore, α commutes with Σ . \square
