## Objectives:

- Define relationships between $f(x), f^{\prime}(x)$ and $f^{\prime \prime}(x)$.
- Use information from $f(x)$ to graph $f^{\prime}(x)$.

What does $f(x)$ tell us about $f^{\prime}(x)$ ?
If $f(x)$ is $\qquad$ at $x=a$, then $f^{\prime}(a)$ is $\qquad$ .
If $f(x)$ is $\qquad$ at $x=a$, then $f^{\prime}(a)$ is $\qquad$ .
If $f(x)$ has a $\qquad$ at $x=a$, then $f^{\prime}(a)=$ $\qquad$ .

Note: If $f(x)$ is discontinuous at $a$, has a corner/cusp at $a$, or has a vertical tangent line at $a$, then $f^{\prime}(a)$ is undefined.
What does $f(x)$ tell us about $f^{\prime \prime}(x)$ ?

Concave $\qquad$

Concave $\qquad$

If $f(x)$ is $\qquad$ , $f^{\prime}(x)$ is $\qquad$ , so $f^{\prime \prime}(x)$ is $\qquad$ .

If $f(x)$ is $\qquad$ , $f^{\prime}(x)$ is $\qquad$ , so $f^{\prime \prime}(x)$ is $\qquad$ .

## Summary

First, look for points where the derivative or second derivative is zero. Then consider where $f^{\prime}(x)$ and $f^{\prime \prime}(x)$ are positive or negative, according to the following patterns:

| $f(x)$ |  |  |
| :--- | :--- | :--- |
| $f^{\prime}(x)$ |  |  |

| $f(x)$ |  |  |
| :---: | :--- | :--- |
| $f^{\prime}(x)$ |  |  |
| $f^{\prime \prime}(x)$ |  |  |

## Example:

|  | $x \in(1,3)$ | $x=3$ | $x \in(3,6)$ | $x=6$ | $x \in(6,7)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $f(x)$ | increasing |  |  |  |  |
| $f^{\prime}(x)$ | + |  |  |  |  |

|  | $x \in(1,3)$ | $x \in(3,5)$ | $x \in(5,7)$ |
| :---: | :---: | :---: | :---: |
| $f(x)$ | concave down |  |  |
| $f^{\prime}(x)$ | decreasing |  |  |
| $f^{\prime \prime}(x)$ |  |  |  |

We'll use these basic rules in today's class activity. The solutions to the activity will be posted on the course website - I would recommend adding at least some of those examples to your notes.
