Groups, orders, and classification

Filippo Calderoni (filippo@calderoni@rutgers.edu) *Rutgers*

In this talk I will discuss the classification problem for various classes of ordered groups. We will see how such Borel classifications are related to one of the most famous problem in mathematical logic: the Vaught's conjecture. Moreover, we will discuss more closely the isomorphism relation for countable Archimedean ordered groups, which represents an interesting a rather unusual example of Borel complexity.
