

1. (6 points) Circle the correct answer.

(a) Determine the partial fraction decomposition of $\frac{x+3}{(x^2-1)(x+2)}$.

(i) $\frac{A}{x-1} + \frac{B}{x^2-1} + \frac{C}{x+2}$

(iii) $\frac{A}{x^2-1} + \frac{B}{x+2}$

(ii) $\frac{A}{x-1} + \frac{B}{x+2}$

(iv) $\frac{A}{x-1} + \frac{B}{x+1} + \frac{C}{x+2}$

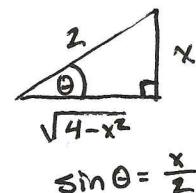

(b) Which trigonometric substitution is needed to integrate $\int \frac{\sqrt{4-x^2}}{x^2} dx$?

(i) $x = 2 \tan(\theta)$

(iii) $x = 2 \sin(\theta)$

(ii) $x = 4 \tan(\theta)$

(iv) $x = 4 \sin(\theta)$

2. (8 points) Evaluate the following indefinite integral. Show all work.

$$\int \arctan(x) dx$$

$$u = \tan^{-1} x$$

$$v = x$$

$$du = \frac{1}{1+x^2} dx \quad dv = dx$$

$$\int u dv = uv - \int v du$$

$$\int \tan^{-1} x dx = x \tan^{-1} x - \int \frac{x}{1+x^2} dx$$

$$= x \tan^{-1} x - \frac{1}{2} \ln(1+x^2) + C$$

Note Including absolute value for the logarithm is not necessary here as $x^2+1 \geq 0$ for all real numbers x .

3. (8 points) Compute the sum of

$$\sum_{n=1}^{\infty} \frac{5 \cdot 2^{n+1}}{3^{2n-1}}.$$

You do not need to simplify.

$$\frac{5 \cdot 2^{n+1}}{3^{2n-1}} = 5 \cdot 2 \left(\frac{2^n}{3^{2n}} \right)$$

$$= 30 \left(\frac{2^n}{3^{2n}} \right) = 30 \left(\frac{2}{9} \right)^n$$

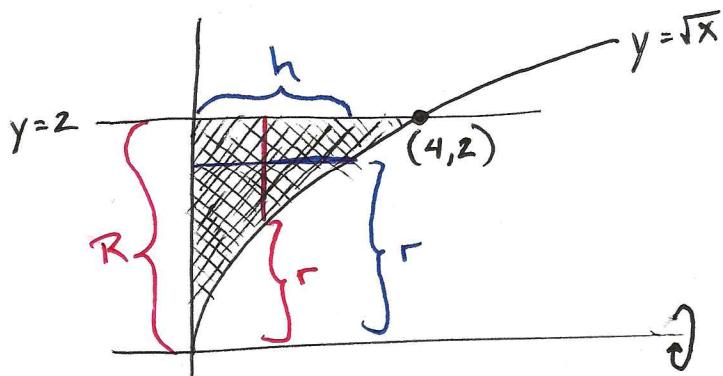

So this series is geometric w/ $a = 30 \cdot \left(\frac{2}{9} \right) = \frac{20}{3}$ (first term)

$$r = \frac{2}{9}$$

$$\Rightarrow \text{Sum is } \frac{a}{1-r} = \frac{\frac{20}{3}}{1-\frac{2}{9}} = \frac{9}{7} \cdot \frac{20}{3} = \frac{180}{21}$$

4. (8 points) Setup but do not compute an integral to find the volume of the solid of revolution determined by rotating the region bounded by $x = 0$, $y = 2$ and $y = \sqrt{x}$ about the x -axis.

Disk method (in red)

$$R = 2, r = \begin{cases} y\text{-coord of } y=\sqrt{x} \\ y=\sqrt{x} \end{cases} = \sqrt{x}$$

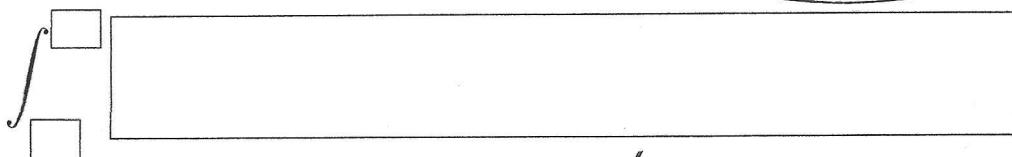

$$\Rightarrow V = \int_0^4 \pi (R^2 - r^2) dx$$

$$= \int_0^4 \pi (4-x) dx$$

Shell Method (in blue)

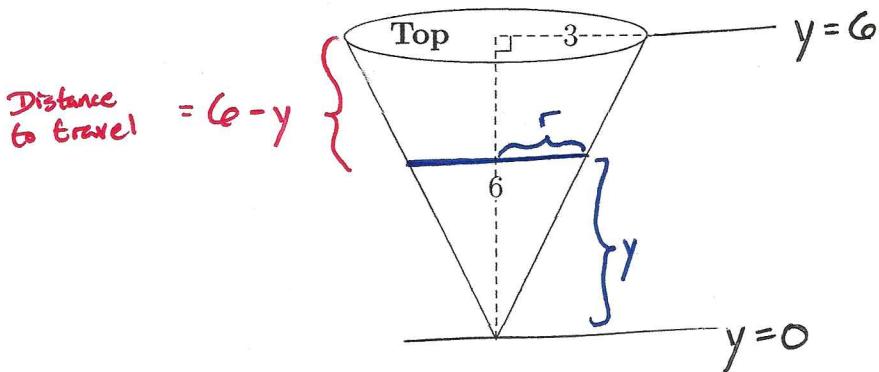

$$r = y, h = \begin{cases} x\text{-coord of } y \\ y=\sqrt{x} \end{cases} = y^2$$

$$V = \int_0^2 2\pi rh dy = \int_0^2 2\pi y^3 dy$$

(Incidentally, both integrals = 8π)

5. (8 points) Setup but do not compute an integral to find the work done pumping the water out of the top of a full tank with the shape of a right circular cone with height 6 meters, radius 3 meters. Express the acceleration due to gravity as g and the density of water as ρ .

$$\begin{aligned}
 W &= \int \text{Force} * \text{Distance} \\
 &= \int (\text{mass} * g)(6-y) \\
 &= \int (\rho * \text{volume})(g)(6-y) \\
 &= \int \rho g (\pi r^2 dy)(6-y)
 \end{aligned}$$

as each blue slab of water
is a disk w/ $\begin{cases} \text{area} = \pi r^2 \\ \text{thickness} = dy \end{cases}$

- Since the tank is full of water, the bounds of integration are from 0 to 6

$$= \int_0^6 \rho g \pi (r^2)(6-y) dy$$

To find how r is related to y , we use similar triangles

$$\frac{3}{6-y} = \frac{r}{y} \Rightarrow r = \frac{1}{2}y$$

$$\int_0^6 \boxed{\rho g \pi \cdot \frac{1}{4}y^2(6-y) dy}$$

6. (8 points) Determine whether the series converges absolutely, converges conditionally, or diverges. Rigorously justify your answer.

$$\sum_{n=1}^{\infty} \frac{(-1)^n}{\sqrt{n+1}}$$

- To show convergence, we apply the Alternating Series Test.
- For $f(n) = \frac{1}{\sqrt{n+1}}$, the function f clearly ① goes to 0 as $n \rightarrow \infty$
- ② $f(n) \geq f(n+1)$ i.e. is decreasing
- So by the AST, $\sum_{n=1}^{\infty} \frac{(-1)^n}{\sqrt{n+1}}$ converges.
- The series in absolute value $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n+1}}$ will be shown to diverge by the Limit Comparison Test w/ $b_n = \frac{1}{\sqrt{n}}$.
- Now both $\frac{1}{\sqrt{n+1}}, \frac{1}{\sqrt{n}} \geq 0$, and $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$ diverges, as seen with the p-test ($p = \frac{1}{2} \leq 1$).
- $$\begin{aligned} \lim_{n \rightarrow \infty} \frac{a_n}{b_n} &= \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n+1}} \cdot \frac{\sqrt{n}}{1} = \lim_{n \rightarrow \infty} \sqrt{\frac{n}{n+1}} \\ &= \sqrt{\lim_{n \rightarrow \infty} \frac{n}{n+1}} = \sqrt{1} = 1. \end{aligned}$$
- As this limit is non-zero and $\sum_{n=1}^{\infty} b_n$ diverges, $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n+1}}$ diverges.
- Thus, $\sum_{n=1}^{\infty} \frac{(-1)^n}{\sqrt{n+1}}$ converges conditionally

7. (8 points) Consider the function $f(x) = e^{3x^2}$.

(a) Write the Maclaurin series for $f(x)$.

$$e^x = \sum_{n=0}^{\infty} \frac{1}{n!} x^n$$

$$\Rightarrow e^{3x^2} = \sum_{n=0}^{\infty} \frac{1}{n!} (3x^2)^n$$

$$= \sum_{n=0}^{\infty} \frac{3^n}{n!} x^{2n}$$

(b) Use the Maclaurin series for $f(x)$ to express $\int_0^1 f(x) dx$ as a series.

$$\int_0^1 f(x) dx = \int_0^1 \sum_{n=0}^{\infty} \frac{3^n}{n!} x^{2n} dx$$

$$= \sum_{n=0}^{\infty} \int_0^1 \frac{3^n}{n!} x^{2n} dx$$

(as the interval of conv.
of $f(x)$'s Maclaurin
series is all reals)

$$= \sum_{n=0}^{\infty} \frac{3^n}{n!} \int_0^1 x^{2n} dx$$

$$= \sum_{n=0}^{\infty} \frac{3^n}{n!} \frac{1}{2n+1} x^{2n+1} \Big|_0^1$$

$$= \sum_{n=0}^{\infty} \frac{3^n}{(2n+1)n!}$$

8. (6 points) Circle the correct answer.

- (a) Find the interval of convergence for the power series $\sum_{n=1}^{\infty} \frac{3^n}{\sqrt{n}} x^n$.

(i) $[-\frac{1}{3}, \frac{1}{3}]$

(ii) $(-\frac{1}{3}, \frac{1}{3})$

(iii) $(-\frac{1}{3}, \frac{1}{3})$

- (b) Using the power series

(iv) $[-\frac{1}{3}, \frac{1}{3}]$

(v) $(-\infty, \infty)$

- If $x = \frac{1}{3}$, the series is $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$ (diverges)
- If $x = -\frac{1}{3}$, $\sum_{n=1}^{\infty} \frac{(-1)^n}{\sqrt{n}}$ (converges)

The interval

$$\frac{1}{R} = \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right|$$

$$= \lim_{n \rightarrow \infty} \frac{3^{n+1}}{\sqrt{n+1}} \cdot \frac{\sqrt{n}}{3^n}$$

$$= \lim_{n \rightarrow \infty} 3 \cdot \frac{\sqrt{n}}{\sqrt{n+1}} = 3$$

$$\Rightarrow R = \frac{1}{3}$$

(i) 333

(iv) 9

(ii) 534

(v) 201

(iii) 100

If $x = 1$, we get $\ln(2) = \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n}$

The Alternating Series Estimation Thm states

$$\left| \text{Error in the partial sum } \sum_{n=0}^N a_n \text{ to approx the series} \right| \leq |a_{N+1}|$$

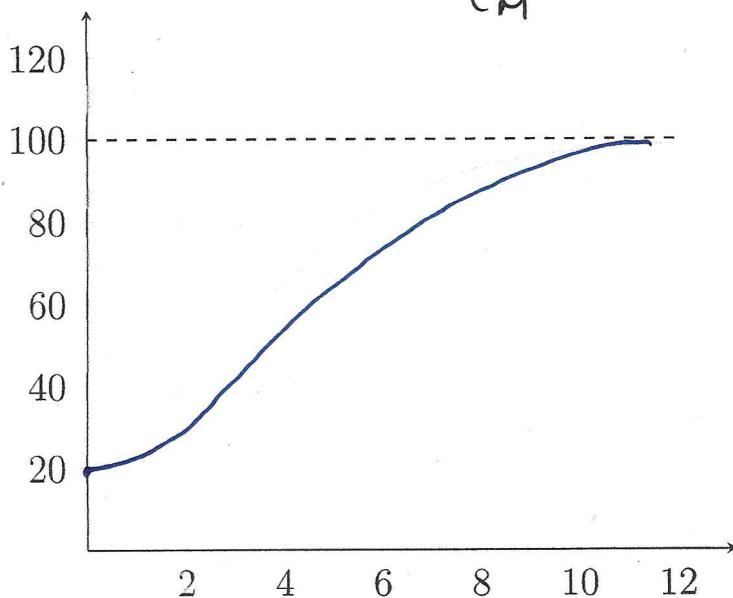

So we want $\frac{1}{n+1} < \frac{3}{1000} \Rightarrow n+1 > \frac{1000}{3} = 333.\bar{3}$

$$\Rightarrow n+1 \geq 334$$

$$\Rightarrow n \geq 333$$

9. (8 points) The following graph is a particular solution to the logistic differential equation

$$\frac{dP}{dt} = .5P \left(1 - \frac{P}{100}\right).$$

- (a) Determine the carrying capacity, M , and the initial population, P_0 .

$$M = 100 \quad (\text{also the asymptotic limit})$$

$$P_0 = 20 \quad (\text{y-intercept})$$

- (b) Which function below represents the particular solution above?

$$(i) \quad P(t) = \frac{1}{1 + 4e^{-0.5t}}$$

$$(ii) \quad P(t) = \frac{100}{1 + 4e^{-0.5t}}$$

$$(iii) \quad P(t) = \frac{100}{1 + 20e^{-0.5t}}$$

$$(iv) \quad P(t) = \frac{1}{1 + 20e^{-0.5t}}$$

For $\frac{dP}{dt} = kP \left(1 - \frac{P}{M}\right)$, the solution is $P = \frac{M}{1 + Ce^{-kt}}$

for some constant C .

$$\text{Since } y(0) = 20, \quad 20 = \frac{100}{1 + C} \Rightarrow 1 + C = \frac{100}{20} = 5 \Rightarrow C = 4$$

10. (8 points) Consider the parametric curve

$$\begin{aligned}x(t) &= t^2 \\y(t) &= 2t + 2.\end{aligned}$$

(a) Find the equation for the tangent line to the parametric curve at $t = 2$.

$$x(2) = 4$$

$$y(2) = 6$$

$$m = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} \Big|_{t=2} = \frac{2}{2t} \Big|_{t=2} = \frac{1}{2}$$

$$y - 6 = \frac{1}{2}(x - 4)$$

(b) Is the parametric curve concave up or down at $t = 2$? Justify your answer.

$$\frac{d^2y}{dx^2} = F'(t) \cdot \frac{1}{\frac{dx}{dt}} \quad \text{for } F(t) = \frac{dy}{dx}$$

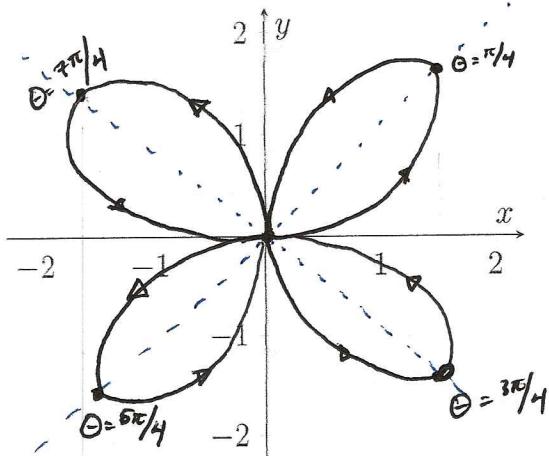

$$\text{As above, } \frac{dy}{dx} = \frac{2}{2t} = \frac{1}{t} \Rightarrow F'(t) = -\frac{1}{t^2}$$

$$\text{So } \frac{d^2y}{dx^2} = -\frac{1}{t^2} \cdot \frac{2t}{1} = -\frac{2}{t}$$

When $t = 2$, $\frac{d^2y}{dx^2} = -1 < 0$, so concave down.

11. (8 points) Follow the given steps to find the area of one petal of the rose curve given by $r = 2 \sin(2\theta)$.

(a) Sketch the graph of $r = 2 \sin(2\theta)$ on the interval $0 \leq \theta \leq 2\pi$.

θ	r
0	0
$\pi/4$	2
$\pi/2$	0
$3\pi/4$	-2
π	0
$5\pi/4$	2
$3\pi/2$	0
$7\pi/4$	-2
2π	0

(b) Fill in the boxes below to set up, but not evaluate, an integral which gives the area of one petal of the rose curve given by $r = 2 \sin(2\theta)$.

$$\int_0^{\pi/2} \frac{1}{2} r^2 d\theta = \int_0^{\pi/2} \frac{1}{2} \cdot (2 \sin(2\theta))^2 d\theta$$

$$= \int_0^{\pi/2} 2 \sin^2(2\theta) d\theta$$

$$\int_0^{\boxed{\pi/2}} \boxed{2 \sin^2(2\theta) d\theta}$$

12. (8 points) Determine whether the following improper integral converges. If the integral does converge, evaluate it.

$$\int_1^{\infty} \frac{e^{-\sqrt{x}}}{\sqrt{x}} dx = \lim_{t \rightarrow \infty} \int_1^t \frac{e^{-\sqrt{x}}}{\sqrt{x}} dx$$

$u = \sqrt{x} \Rightarrow du = \frac{1}{2\sqrt{x}} dx$
 If $x=1, u=1$
 $x=t, u=\sqrt{t}$

$$= \lim_{t \rightarrow \infty} \int_1^{\sqrt{t}} 2e^{-u} du$$

$$= \lim_{t \rightarrow \infty} -2e^{-u} \Big|_1^{\sqrt{t}}$$

$$= \lim_{t \rightarrow \infty} -2e^{-\sqrt{t}} + 2e$$

$$= 2e$$

The improper integral converges to $2e$.

13. (8 points) Find $\frac{dy}{dx}$ of the polar function $r = 2 \cos(3\theta)$.

$$\frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} \quad \text{for} \quad y = r \sin \theta = 2 \sin \theta \cos(3\theta)$$

$$x = r \cos \theta = 2 \cos \theta \cos(3\theta)$$

$$\frac{dy}{d\theta} = 2 \cos \theta \cos(3\theta) - 6 \sin \theta \sin(3\theta)$$

$$\frac{dx}{d\theta} = -2 \sin \theta \cos(3\theta) - 6 \cos \theta \sin(3\theta)$$

so $\frac{dy}{dx} = \frac{2 \cos \theta \cos(3\theta) - 6 \sin \theta \sin(3\theta)}{-2 \sin \theta \cos(3\theta) - 6 \cos \theta \sin(3\theta)}$
