

Seminar on Stacks and Groupoids

# Things to do with groupoids

**Arlan Ramsay**

University of Colorado at Boulder

I plan to describe some operations that are useful when using groupoids, naming examples where some of them have been applied. These are mostly in connection with representations of locally compact groups or non-commutative geometry. One view of NCG is that it is a way to work with such things as quotient spaces when the quotient spaces in the ordinary sense are useless. That is in the same general spirit as stacks, but in different settings.
