

Exercise 2.7.3

Linear Algebra MATH 2130

SEBASTIAN CASALAINA

ABSTRACT. This is Exercise 2.7.3 from Lay [LLM21, §2.7]:

Exercise 2.7.3. Find the 3×3 matrix that produces the following composite 2D map (“**transformation**”), using homogeneous coordinates: *Translate by $(3, 1)$ and then rotate 45° (counter clock-wise) about the origin.*

Solution. Let’s use the notation that $T_{(a,b)}$ is the (non-linear) map that translates points in the plane by the point (a, b) , and that R_θ is the linear map that rotates points in the plane (counter clock-wise) about the origin. Then the map we want is the composition $R_{45^\circ} \circ T_{(3,1)}$.

To do this with matrices, first recall that since $T_{(a,b)}$, is given by $T_{(a,b)}(x_1, x_2) = (x_1 + a, x_2 + b)$, this is given in \mathbb{R}^3 with third coordinate 1 by $(x_1, x_2, 1) \mapsto (x_1 + a, x_2 + b, 1)$, which in homogeneous coordinates means

$$(x_1, x_2, x_3) \mapsto (x_1 + ax_3, x_2 + bx_3, x_3).$$

(Taking $x_3 = 1$ is the map we described in \mathbb{R}^3 .) From the above, we can see that $T_{(a,b)}$ in homogeneous coordinates is given by the linear map associated with the matrix

$$T_{(a,b)} : \begin{bmatrix} 1 & 0 & a \\ 0 & 1 & b \\ 0 & 0 & 1 \end{bmatrix}$$

Similarly, one has that rotation through the angle θ around the origin is given by

$$R_\theta : \begin{bmatrix} \cos \theta & -\sin \theta & 0 \\ \sin \theta & \cos \theta & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Therefore, the composition $R_{45^\circ} \circ T_{(3,1)}$ corresponds to

$$R_{45^\circ} \circ T_{(3,1)} : \begin{bmatrix} \frac{\sqrt{2}}{2} & -\frac{\sqrt{2}}{2} & 0 \\ \frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{2} & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 3 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} \frac{\sqrt{2}}{2} & -\frac{\sqrt{2}}{2} & \sqrt{2} \\ \frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{2} & 2\sqrt{2} \\ 0 & 0 & 1 \end{bmatrix}$$
