

# Reference: Cross-Section Area Formulas

## Overview

For a solid defined by cross-sections perpendicular to an axis, the volume is the integral of the Area function  $A(x)$ .

$$V = \int_a^b A(x) dx$$

In the table below,  $s$  represents the length of the slice (base) sitting on the region in the  $xy$ -plane.

Shape	Diagram	Area Formula
<b>1. Square</b> Side length $s$		$A = s^2$
<b>2. Rectangle</b> Base $b$ , Height $h$		$A = b \cdot h$ <i>Note: <math>h</math> is often constant or a function of <math>x</math>.</i>
<b>3. Isosceles Right Triangle</b> Leg length $s$		$A = \frac{1}{2}s^2$
<b>4. Equilateral Triangle</b> Side length $s$		$A = \frac{\sqrt{3}}{4}s^2$
<b>5. Circular (Disk)</b> Radius $r$		$A = \pi r^2$ <b>Watch out:</b> If the base on the graph is diameter $s$ , then $r = s/2$ .
<b>6. Semicircle</b> Radius $r$		$A = \frac{1}{2}\pi r^2$ <b>Watch out:</b> Usually the base $s$ is the diameter, so $r = s/2$ .
<b>7. Quarter Circle</b> Radius $r$		$A = \frac{1}{4}\pi r^2$ <b>Note:</b> Here, the base $s$ is typically the radius itself, so $r = s$ .
