<p>GROUPS</p> <p>(Techniques for producing normal subgroups in groups of order <math>n</math>)</p> <p>Describe the technique known as "studying normalizers of intersections of Sylow <math>p</math>-subgroups."</p> <p>ALGEBRA PRELIM</p>	<p>GROUPS</p> <p>What is the universal property of the free group <math>F(S)</math> on a set <math>S</math>?</p> <p>ALGEBRA PRELIM</p>

<p>The <i>derived</i> or <i>commutator series</i> of a group <math>G</math> is the following sequence of groups, defined inductively <math>\forall i \geq 1</math>.</p> $G^{(0)} = G \quad G^{(1)} = [G, G] \quad G^{(i+1)} = [G^{(i)}, G^{(i)}]$	<p>For a group <math>G</math>, the <i>lower central series</i> is the chain of subgroups</p> $G^0 \geq G^1 \geq G^2 \geq \dots$ <p>where the subgroups are defined inductively as <math>G^0 = G</math>, <math>G^1 = [G, G]</math>, and <math>G^{i+1} = [G, G^i]</math>.</p>
<p>Such groups are solvable.</p>	<p><math>G</math> is solvable if and only if <math>G^{(n)} = 1</math> for some <math>n \geq 0</math>.</p>
<p>Let <math> G  = n</math>, <math>H \leq G</math>, <math>[G : H] = k</math>. <math>G</math> acting on cosets of <math>H</math> by left multiplication induces a map from <math>G</math> to <math>S_k</math>. Suppose <math>G</math> is simple so that the kernel is trivial. Then <math>G</math> is isomorphic to a subgroup of <math>S_k</math> so <math>n \mid k!</math>. Because of this argument, if <math>k</math> is the smallest integer such that <math>n \mid k!</math>, then <math>\nexists H &lt; G</math> with index less than <math>k</math>.</p> <p>ex) Suppose <math>n = 3993 = 3^2 \cdot 13 \cdot 29</math>. The possible indices of a subgroup are <math>3, 9, 13, \dots</math>. Of these, only <math>29!</math> is divisible by <math>3993</math>.</p>	<p>Use this technique when for <math>P \in \text{Syl}_p(G)</math>, <math> P  = p</math>.</p> <p>Suppose by contradiction the group is simple so that the number of Sylow <math>p</math>-subgroups is greater than 1 (i.e. <math>n_p &gt; 1</math>). Since each Sylow <math>p</math>-subgroup intersects only at the identity, count the number of elements in each subgroup. If the total elements counted is greater than <math>n</math>, then at least one <math>n_p</math> must be 1 and the unique Sylow <math>p</math>-subgroup is normal.</p>
<p>This technique is for primes <math>p, q</math> such that <math>p &lt; q</math> and <math>p \nmid q - 1</math> (this makes groups of order <math>pq</math> cyclic).</p> <p>If <math>G</math> has a Sylow <math>q</math>-subgroup <math>Q</math> of order <math>q</math> and <math>p \mid  N_G(Q) </math>, then Cauchy's Theorem says <math>P = \langle p \rangle</math> is a group of order <math>p</math> that normalizes <math>Q</math>. Then <math>PQ</math> is cyclic and thus abelian, so <math>PQ \leq N_G(P)</math> and <math>q \mid  N_G(P) </math>. This may force <math>N_G(P) = G</math> or may force the index of <math>N_G(P)</math> to be lower than that which is allowable by the "exploiting subgroups of small index" technique.</p>	<p>Let <math> G  = n</math> and <math>H</math> a subgroup of index <math>k</math>. Let <math>\varphi : G \rightarrow S_k</math> be the permutation representation of <math>G</math> by action on cosets of <math>H</math>. Suppose that <math>G</math> is simple. Then the kernel is trivial and <math>G</math> is isomorphic to a subgroup of <math>S_k</math>. We can attempt to show that <math>S_k</math> contains no simple subgroup of order <math>n</math>.</p> <p>We can use facts such as (1) if <math>G</math> contains an element/subgp of some order, so must <math>S_k</math> and (2) if <math>P \in \text{Syl}_p(G)</math> and <math>P \in \text{Syl}_p(S_k)</math>, then <math> N_G(P) </math> divides <math> N_{S_k}(P) </math>.</p>
<p>Any map from set <math>S</math> to a group <math>G</math> extends uniquely to a homomorphism <math>\varphi</math> from <math>F(S)</math> to <math>G</math>.</p> $  \begin{array}{ccc}  S & \longrightarrow & F(S) \\  & \searrow & \vdots \varphi \\  & & G  \end{array}  $	<p>Suppose <math>R, P \in \text{Syl}_p(G)</math> are distinct subgroups and <math>R \cap P \neq 1</math>. Then by property 4 in the list of properties of <math>p</math>-groups, <math>P_0 = R \cap P</math> satisfies <math>P_0 &lt; N_P(P_0)</math> and <math>P_0 &lt; N_R(P_0)</math>. This may cause the normalizer in <math>G</math> of <math>P_0</math> to have too small an index to satisfy the bound provided by the "exploiting subgroups of small index" technique.</p>

<p>GROUPS</p> <p style="text-align: center;"><i>What is a <u>free group</u>?</i></p> <p style="text-align: right;">ALGEBRA PRELIM</p>	<p>GROUPS</p> <p style="text-align: center;"><i>The derived series of a group terminates (every group in the chain is eventually trivial group 1) if and only if the group is _____</i></p> <p style="text-align: right;">ALGEBRA PRELIM</p>
<p>GROUPS</p> <p style="text-align: center;"><i>If <math>G, H</math> are solvable groups, which of the following are also solvable? The direct product <math>H \times G</math>? The semidirect product <math>H \rtimes G</math>? Any subgroup <math>K</math> of <math>G</math>? The quotient <math>G/N</math> for some normal subgroup <math>N</math> of <math>G</math>?</i></p> <p style="text-align: right;">ALGEBRA PRELIM</p>	<p>GROUPS</p> <p style="text-align: center;"><i>Let <math>a</math> be an element of order <math>n</math> and <math>b</math> be an element of order <math>m</math>. Is it true that <math>\langle a, b \rangle</math> has order <math>\text{lcm}(a, b)</math>?</i></p> <p style="text-align: right;">ALGEBRA PRELIM</p>
<p>GROUPS</p> <p style="text-align: center;"><i>State and prove Frattini's Argument.</i></p> <p style="text-align: right;">ALGEBRA PRELIM</p>	<p>GROUPS</p> <p style="text-align: center;"><i>Prove that if <math>G</math> is solvable, then <math>G/N</math> is solvable.</i></p> <p style="text-align: right;">ALGEBRA PRELIM</p>
<p>GROUPS</p> <p style="text-align: center;"><i>Prove that if <math>N \trianglelefteq G</math>, <math>N</math> is solvable, and <math>G/N</math> is solvable, then <math>G</math> is solvable.</i></p> <p style="text-align: right;">ALGEBRA PRELIM</p>	<p>RINGS</p> <p style="text-align: center;"><i>What is a <u>ring</u>?</i></p> <p style="text-align: right;">ALGEBRA PRELIM</p>
<p>RINGS</p> <p style="text-align: center;"><i>What is a <u>division ring</u>? What is another name for a commutative division ring?</i></p> <p style="text-align: right;">ALGEBRA PRELIM</p>	<p>RINGS</p> <p style="text-align: center;"><i>What is an <u>integral domain</u>? What desirable property do integral domains possess? What desirable property do finite integral domains possess?</i></p> <p style="text-align: right;">ALGEBRA PRELIM</p>

<p>solvable</p>	<p>A free group is a group with no relations. Its elements are just the <i>words</i> made by the generators in some set <math>S</math>.</p>
<p>No, this is not generally true. If the permutation representations of <math>a</math> and <math>b</math> are disjoint, then it is true.</p>	<p>These are all solvable. Ha!</p>
<p><math>G</math> is a composition series such that each successive quotient is abelian. Quotienting every group in the series produces a composition series for <math>G/N</math> such that each successive quotient is abelian. Thus <math>G/N</math> is solvable.</p>	<p>If <math>H \trianglelefteq G</math> and <math>P \in \text{Syl}_p(H)</math>, then <math>G = N_G(P)H</math></p> <p><i>Proof:</i> Let <math>g \in G</math>. Then <math>g^{-1}Pg \in H</math> since <math>H \trianglelefteq G</math>. Thus <math>g^{-1}Pg</math> is also a Sylow <math>p</math>-subgroup of <math>H</math>. Since all Sylow <math>p</math>-subgroups of <math>H</math> must be conjugate by some element of <math>H</math>, there exists <math>h \in H</math> such that</p> $h(g^{-1}Pg)h^{-1} = P.$ <p>So <math>gh^{-1} \in N_G(P)</math> and <math>g \in N_G(P)H</math>. Since <math>g</math> was arbitrary, <math>G \subseteq N_G(P)H</math> which implies <math>G = N_G(P)H</math>.</p>
<p>A <i>ring</i> <math>R</math> is a set together with two binary operations <math>+</math> and <math>\times</math> such that</p> <ol style="list-style-type: none"> <li>1. <math>(R, +)</math> is an abelian group</li> <li>2. <math>\times</math> is associative</li> <li>3. The distributive property holds</li> </ol>	<p><math>N</math> is solvable so there is composition series <math>1 = N_0 \trianglelefteq \dots \trianglelefteq N_n = N</math> so that <math>N_{i+1}/N_i</math> is abelian. Likewise there is a series for <math>\overline{G} = G/N</math> composed of subgroups <math>\overline{G}_i</math>. By the Lattice isomorphism theorem, there are subgroups <math>G_i</math> of <math>G</math> containing <math>N</math> such that <math>G_i/N = \overline{G}_i</math>. Thus we can form the following composition series for <math>G</math>, each successive quotient is abelian, and <math>G</math> is solvable:</p> $1 = N_0 \trianglelefteq \dots \trianglelefteq N_n = N = G_0 \trianglelefteq \dots \trianglelefteq G_m = G$
<p>An <i>integral domain</i> is a ring with no zero divisors.</p> <p>Integral domains possess the cancellation property.</p> <p>Finite integral domains are fields.</p>	<p>A ring with identity (<math>1 \neq 0</math>) is a <i>division ring</i> if every nonzero element has a multiplicative inverse.</p> <p>A commutative division ring is a <i>field</i>.</p>

<p>RINGS</p> <p>What is a <u>left ideal</u>?</p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p>What is the <u>subring criterion</u>?</p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p>What is a <u>ring homomorphism</u>?</p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p>Is the kernel of a ring homomorphism an ideal of the domain?</p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p>Let <math>I, J</math> be ideals of ring <math>R</math>.  What is <math>I + J</math>? Is it an ideal of <math>R</math>?  What is <math>IJ</math>? Is it an ideal of <math>R</math>?</p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p>Let <math>I, J</math> be ideals of ring <math>R</math>. Is it true that <math>I \cap J \subseteq IJ</math>?</p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p>Given a ring <math>R</math> and some subset <math>A</math>, what is the ideal generated by <math>A</math>?</p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p>Given a ring <math>R</math> and ideal <math>I</math>, what is the condition that guarantees <math>I = R</math>?</p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p>If <math>R</math> is a field, then what can we say about a nonzero ring homomorphism from <math>R</math> to another ring?</p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p>What is a <u>maximal ideal</u>? Does every ring have maximal ideals? Which rings always have maximal ideals?</p> <p>ALGEBRA PRELIM</p>

<p>Given any subset <math>S</math> of a ring <math>R</math>, we know that <math>S</math> is a subring if <math>S</math> is nonempty and closed under subtraction and multiplication.</p>	<p>Let <math>R</math> be a ring, <math>I</math> a subset of <math>R</math>, and <math>r \in R</math>. <math>I</math> is an <i>ideal</i> of <math>R</math> if</p> <ol style="list-style-type: none"> <li>1. <math>I</math> is a subring of <math>R</math> and</li> <li>2. <math>I</math> is closed under left multiplication by elements from <math>R</math>.</li> </ol>
<p>Yes indeedy.</p>	<p>Let <math>R, S</math> be rings and <math>\varphi : R \rightarrow S</math>. Then <math>\varphi</math> is a <i>ring homomorphism</i> if <math>\varphi(a + b) = \varphi(a) + \varphi(b)</math> and <math>\varphi(ab) = \varphi(a)\varphi(b)</math>.</p>
<p>No. <math>IJ \subseteq I \cap J</math>. Sometimes <math>IJ</math> may even be strictly smaller.</p>	<p><math>I + J = \{a + b \mid a \in I, b \in J\}</math> This is an ideal of <math>R</math>.</p> <p><math>IJ = \{a_1 b_1 + \dots + a_n b_n \mid a_1, \dots, a_n \in I, b_1, \dots, b_n \in J, n \in \mathbb{Z}^+\}</math> This is an ideal of <math>R</math>.</p> <p>Note: <math>S = \{ij \mid i \in I, j \in J\}</math> is not necessarily an ideal.</p>
<p><math>I = R</math> if and only if <math>I</math> contains a unit</p> <p><i>Proof:</i> (<math>\rightarrow</math>) If <math>I = R</math>, then <math>I</math> contains 1, which is a unit.</p> <p>(<math>\leftarrow</math>) If <math>a \in I</math> is a unit, then <math>a^{-1} \in I</math> as well. By the multiplicative sucking property, <math>a^{-1}a \in I</math> and so <math>1 \in I</math>. Then every element of <math>R</math> is in <math>I</math> and <math>R = I</math>.</p>	<p>The left ideal generated by <math>A</math> is</p> $RA = \{r_1 a_1 + r_2 a_2 + \dots + r_n a_n \mid r_i \in R, a_i \in A, n \in \mathbb{Z}^+\}.$
<p>An ideal <math>M</math> in a ring <math>S</math> is called a <i>maximal ideal</i> if <math>M \neq S</math> and the only ideals containing <math>M</math> are <math>M</math> and <math>S</math>.</p> <p>No, not every ring has maximal ideals. For example, <math>\mathbb{Q}</math> equipped with standard addition and trivial multiplication (<math>ab = 0 \forall a, b \in \mathbb{Q}</math>) has no maximal ideals. We can perform this construction for any abelian group that has no maximal subgroups.</p> <p>In a ring with identity, every proper ideal is contained in a maximal ideal.</p>	<p>That homomorphism is injective. The kernel of the homomorphism would need to be an ideal, and the only ideals in a field are 0 and <math>R</math>. Since the homomorphism is nonzero, the kernel is not all of <math>R</math>. Thus the kernel is 0 and the map is injective.</p>

<p>RINGS</p> <p><i>Let <math>R</math> be a ring and <math>I</math>. What can be said about <math>R/I</math> when <math>I</math> is maximal? What can be said about <math>R/I</math> when <math>I</math> is prime?</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>What is a <u>prime ideal</u>?</i></p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p><i>In a commutative ring with unity, is every prime ideal a maximal ideal or is every maximal ideal a prime ideal? Give an example. In what kind of ring do prime and maximal ideals coincide?</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>Given a ring <math>R</math>, what is its <u>ring of fractions</u>? Under what condition is the ring of fractions a field?</i></p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p><i>Let <math>A, B</math> be ideals in ring <math>R</math>. What does it mean for <math>A</math> and <math>B</math> to be <u>comaximal</u>?</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>State the Chinese Remainder Theorem. Give an example.</i></p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p><i>What is a <u>Euclidean domain</u>?</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>What is a <u>norm</u> on an integral domain <math>R</math>? What is a <u>positive norm</u>?</i></p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p><i>What is the <u>greatest common divisor</u> of <math>a, b</math>?</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>Let <math>R</math> be a commutative ring and <math>a, b \in R</math>. If <math>(a, b) = (d)</math> for some element <math>d</math>, what do we know about <math>d</math>?</i></p> <p>ALGEBRA PRELIM</p>

<p>Assume <math>R</math> is a commutative ring. The ideal <math>P</math> is a <i>prime ideal</i> if <math>P \neq R</math> and whenever <math>ab \in P</math>, at least one of <math>a</math> or <math>b \in P</math>.</p>	<p><math>R/I</math> is a field if and only if <math>I</math> is a maximal ideal.</p> <p><math>R/I</math> is an integral domain if and only if <math>I</math> is a prime ideal.</p>
<p>Let <math>R</math> be a commutative ring and <math>D</math> a nonempty subset of <math>R</math> that does not contain 0 or zero divisors and is closed under multiplication. Then the <i>ring of fractions</i> is <math>Q = \left\{ \frac{r}{d} \mid r \in R, d \in D \right\}</math>.</p> <p>If <math>D = R - \{0\}</math> (i.e. <math>R</math> is an integral domain) then <math>Q</math> is a field.</p>	<p>Every maximal ideal is a prime ideal. The converse is not always true: in any nonfield integral domain, the zero ideal is a prime ideal which is not maximal.</p> <p>In a PID, every nonzero prime ideal is maximal.</p>
<p>Let <math>A_1, \dots, A_k</math> be ideals in ring <math>R</math>. The map <math>R \rightarrow R/A_1 \times \dots \times R/A_k</math> defined by <math>r \mapsto (r + A_1, \dots, r + A_k)</math> is a ring homomorphism with kernel <math>A_1 \cap \dots \cap A_k</math>.</p> <p>If each pair of ideals in the list is comaximal, then this map is surjective and <math>A_1 \cap \dots \cap A_k = A_1 A_2 \dots A_k</math> so that <math>R/(A_1 A_2 \dots A_k) = R/(A_1 \cap \dots \cap A_k) \cong R/A_1 \times \dots \times R/A_k</math>.</p> <p>ex.) If integer <math>n</math> has prime factorization <math>p_1^{\alpha_1} \dots p_k^{\alpha_k}</math>, then <math>\mathbb{Z}/n\mathbb{Z} \cong (\mathbb{Z}/p_1^{\alpha_1}\mathbb{Z}) \times \dots \times (\mathbb{Z}/p_k^{\alpha_k}\mathbb{Z})</math> and <math>(\mathbb{Z}/n\mathbb{Z})^\times \cong (\mathbb{Z}/p_1^{\alpha_1}\mathbb{Z})^\times \times \dots \times (\mathbb{Z}/p_k^{\alpha_k}\mathbb{Z})^\times</math>.</p>	<p>Ideals <math>A</math> and <math>B</math> are <i>comaximal</i> if <math>A + B = R</math>.</p>
<p>A <i>norm</i> on integral domain <math>R</math> is a function <math>N : R \rightarrow \mathbb{Z}_{\geq 0}</math> such that <math>N(0) = 0</math>. If in addition, <math>N(a) \neq 0</math> for <math>a \neq 0</math>, then <math>N</math> is a <i>positive norm</i>.</p>	<p>An integral domain <math>R</math> is a <i>Euclidean domain</i> if there exists a norm <math>N</math> on <math>R</math> such that for <math>a, b \in R</math>, there exist <math>q, r \in R</math> such that</p> $a = qb + r \quad \text{with } r = 0 \text{ or } N(r) < N(b)$
<p><math>d</math> is the greatest common divisor of <math>a, b</math>.</p> <p><i>Warning:</i> This is <i>not</i> saying that <math>(a, b) = (gcd(a, b))</math> (which is true in a Euclidean domain). This is saying that if <math>(a, b) = (d)</math>, then <math>d</math> is the GCD.</p> <p>In general, it is possible that <math>(a, b) \neq (gcd(a, b))</math>. In <math>\mathbb{Z}[x]</math>, the ideal <math>(2, x)</math> is not the whole ring. However, their GCD is 1 and the ideal <math>(1)</math> is indeed the whole ring</p>	<p>A <i>greatest common divisor</i> of <math>a, b</math> is a nonzero element <math>d</math> such that</p> <ol style="list-style-type: none"> <li><math>d \mid a</math></li> <li><math>d \mid b</math></li> <li>if <math>d' \mid a</math> and <math>d' \mid b</math>, then <math>d' \mid d</math>.</li> </ol>

<p>RINGS</p> <p><i>In what kind of ring is it true that any two elements from the ring are guaranteed to have a greatest common divisor?</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>Let <math>R</math> be an integral domain. If <math>(d) = (d')</math>, prove that <math>d = ud'</math> for some unit <math>u</math>.</i></p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p><i>In what kind of ring is it true that if <math>(a, b) = (d)</math>, then <math>d = \gcd(a, b)</math>?</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>Let <math>I</math> be an ideal and suppose <math>ab \in I</math> but <math>a, b \notin I</math>. Why is it the case that <math>a, b</math> are not units?</i></p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p><i>What is a <u>principal ideal domain</u>?</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>If <math>R</math> is a commutative ring such that <math>R[x]</math> is a PID, prove that <math>R</math> is a field.</i></p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p><i>Let <math>R</math> be an integral domain. What does it mean for <math>r \in R</math> to be <u>irreducible</u>? What does it mean for <math>r</math> to be <u>prime</u>? What is the relationship between these two terms?</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>In what type of ring is a prime element the same as an irreducible element? In general, does prime imply irreducible or does irreducible imply prime? Give an example of an element that has one property but not the other.</i></p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p><i>Prove that a prime element is always irreducible in an integral domain.</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>What is a <u>unique factorization domain</u>?</i></p> <p>ALGEBRA PRELIM</p>

<p>This is clear if <math>d</math> or <math>d'</math> is zero, so suppose both are nonzero. Since <math>d \in (d')</math>, there exists <math>x \in R</math> such that <math>d = xd'</math>. Likewise there exists <math>y \in R</math> so that <math>d' = yd</math>. Thus <math>d = xyd</math> and <math>d(1 - xy) = 0</math>. Since <math>d \neq 0</math>, <math>xy = 1</math>.</p>	<p>UFDs.</p> <p>The division algorithm in a Euclidean domain gives a convenient way to compute it, but the GCD is guaranteed to exist for any two ring elements in a GCD domain. A UFD is always a GCD domain.</p>
<p>Suppose by contradiction that <math>b</math> is a unit. Since <math>ab \in I</math>, by the multiplicative sucking property, <math>(ab)b^{-1} \in I</math>. But this implies that <math>a \in I</math>, contrary to our premise. Thus <math>b</math> is not a unit.</p>	<p><math>a</math> and <math>b</math> need to be nonzero elements in a commutative ring.</p>
<p><math>R</math> is a subring of <math>R[x]</math>, so <math>R</math> must also be an integral domain. Since <math>R[x]/(x)</math> is isomorphic to <math>R</math> and <math>R</math> is an integral domain, we know that <math>(x)</math> is a prime ideal. In a PID, a prime ideal is also a maximal ideal. Thus <math>R[x]/(x) \cong R</math> is a quotient by a maximal ideal and hence is a field.</p>	<p>A <i>principal ideal domain</i> is an integral domain in which every ideal is principal.</p>
<p>In an integral domain, every prime element is irreducible.</p> <p>Every irreducible element is also prime in a PID.</p> <p>In <math>\mathbb{Z}[\sqrt{-5}]</math>, the number 3 is irreducible but not a prime because <math>9 = (2 + \sqrt{-5})(2 - \sqrt{-5})</math> and <math>3 \mid 9</math> but 3 does not divide either of the two factors of 9.</p>	<p>Suppose <math>r \neq 0</math> and <math>r</math> is not a unit. An element <math>r</math> is irreducible if whenever <math>r = ab</math> for <math>a, b \in R</math>, one of <math>a</math> or <math>b</math> is a unit.</p> <p>An element <math>r</math> is prime if the ideal <math>(r)</math> is a prime ideal. In a PID, an irreducible element is also prime.</p> <p>In an integral domain, a prime element is always irreducible.</p>
<p>A <i>unique factorization domain</i> is an integral domain <math>R</math> in which every nonzero element <math>r</math> that is not a unit has a unique factorization into irreducible elements and that this factorization is unique up to multiplication by units.</p>	<p>Take prime element <math>p</math> such that <math>p = ab</math>. Then <math>ab = p \in (p)</math> so either <math>a</math> or <math>b</math> is in <math>(p)</math>. Assume WLOG <math>a \in (p)</math>. Then <math>a = pr</math> for some <math>r \in R</math>. Thus <math>p = ab = prb</math> and <math>rb = 1</math> so <math>b</math> is a unit.</p>

<p>RINGS</p> <p><i>What are the primes in <math>\mathbb{Z}[i]</math>?</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>Under what conditions is a prime <math>p</math> the sum of two integer squares? (i.e. State Fermat's Theorem of the sum of squares.)</i></p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p><i>State the containment chain for different kinds of commutative rings. Give an example from each superset that is not contained in its subset.</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>If <math>F</math> is a field, then <math>F[x]</math> is what kind of ring? What are the maximal ideals of <math>F[x]</math>? Give a proof.</i></p> <p>ALGEBRA PRELIM</p>

<p>The prime <math>p</math> is the sum of two integer squares, <math>p = a^2 + b^2</math>, if and only if <math>p = 2</math> or <math>p \equiv 1 \pmod{4}</math>. This representation of <math>p</math> is unique.</p>	<p>A Gaussian integer <math>a + bi</math> is a Gaussian prime if and only if either</p> <ul style="list-style-type: none"> <li>• one of <math>a, b</math> is zero and the other is a prime of the form <math>4n + 3</math> or <math>-(4n + 3)</math> or</li> <li>• both <math>a, b \neq 0</math> and <math>a^2 + b^2</math> is a prime.</li> </ul>
<p><math>F[x]</math> is a Euclidean domain.</p>	<p><math>E \subseteq P \subseteq U \subseteq I \subseteq C</math></p> <ul style="list-style-type: none"> <li>• <math>\mathbb{Z}/n\mathbb{Z}</math>, <math>n</math> not prime, <math>\in C</math> but <math>\notin I</math>.</li> <li>• <math>\mathbb{Z}[\sqrt{-5}] \in I</math> but <math>\notin U</math> because 6 factors as <math>2 \cdot 3</math> and <math>(1 + \sqrt{-5})(1 - \sqrt{-5})</math>.</li> <li>• <math>\mathbb{Z}[x]</math> is a UFD but not a PID</li> <li>• The ring of integers in <math>\mathbb{Q}(\sqrt{-19})</math>, which is numbers of the form <math>(a + b\sqrt{-19})/2</math> with <math>a, b</math> both even or both odd, is a PID but not Euclidean.</li> </ul>
<p>The polynomial ring is also a UFD.</p>	<p>Let <math>R</math> be a UFD with field of fractions <math>F</math> and let <math>p(x) \in R[x]</math>. If <math>p(x)</math> is reducible/irreducible in <math>F[x]</math>, then it is reducible/irreducible over <math>R[x]</math></p>
<p>Let <math>R</math> be an integral domain with prime ideal <math>P</math>. Let <math>p(x)</math> be a <i>monic</i> polynomial of degree <math>\geq 1</math> in <math>R[x]</math>. If every coefficient except the leading coefficient is in <math>P</math> and the constant term is not in <math>P^2</math>, then <math>p(x)</math> is irreducible in <math>R[x]</math>.</p>	<p>Let <math>R</math> be an integral domain with ideal <math>I</math>. Let <math>p(x)</math> be a nonconstant polynomial in <math>R[x]</math>. If the image of <math>p(x)</math> in <math>(R/I)[x]</math> cannot be factored into two polynomials of smaller degree, then <math>p(x)</math> is irreducible in <math>R[x]</math>.</p> <p><i>Note:</i> The converse is not true. This theorem can fail to detect irreducibility. For example, <math>x^4 - 72x^2 + 4</math> is irreducible, but is reducible modulo every integer.</p>
<p>The maximal ideals of <math>F[x]</math> are those generated by irreducible elements.</p> <p><i>Proof:</i> Since <math>F[x]</math> is Euclidean, irreducible elements are prime (in PIDs) and prime elements generate maximal ideals (in PIDs).</p>	<p>First we shift the polynomial. Let <math>f(x) = x^4 + 1</math> and <math>g(x) = f(x + 1) = x^4 + 4x^3 + 6x^2 + 4x + 2</math>. Now <math>g(x)</math> is irreducible by Eisenstein's, so <math>f(x)</math> must also be irreducible since any factorization of <math>g</math> yields a factorization of <math>f</math>.</p>

<p>RINGS</p> <p><i>Let <math>F</math> be a field so that <math>F[x]</math> is a polynomial ring. What kind of ring is <math>F[x]</math>?</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>Let <math>F</math> be a field so that <math>R = F[x_1, \dots, x_n]</math> is a polynomial ring. What kind of ring is <math>R</math>?</i></p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p><i>What is a <u>Noetherian</u> ring?</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>Let <math>R</math> be a Noetherian Ring so that <math>R[x]</math> is a polynomial ring. What kind of ring is <math>R[x]</math>?</i></p> <p>ALGEBRA PRELIM</p>
<p>RINGS</p> <p><i>Prove that if <math>F</math> is a field, then <math>F[x_1, \dots, x_n]</math> is Noetherian.</i></p> <p>ALGEBRA PRELIM</p>	<p>RINGS</p> <p><i>Let <math>R</math> be a ring and <math>I</math> its unique maximal ideal. Prove that <math>I</math> must contain every element of <math>R</math> that is not a unit.</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>True or False: A submodule of a finitely-generated module is also finitely generated. Give a proof or counterexample</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>True or False: If a module and its submodule are both finitely generated, then the minimal number of generators of the module is greater or equal to the minimal number of generators of the submodule.</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>What is a (left) <u><math>R</math>-module</u>?</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>What is a <u>submodule</u>?</i></p> <p>ALGEBRA PRELIM</p>

<p><math>R</math> is a UFD. It is not a PID unless <math>n = 1</math>.</p>	<p><math>F[x]</math> is a Euclidean domain</p>
<p><math>R[x]</math> is Noetherian. This is known as <i>Hilbert's Basis Theorem</i>.</p>	<p>A commutative ring <math>R</math> with 1 is <i>Noetherian</i> if every ideal of <math>R</math> is finitely generated.</p>
<p>Let <math>r \in R</math> be an element that is not a unit. Then the ideal <math>(r)</math> is contained in some maximal ideal. Since <math>I</math> is the unique maximal ideal, <math>r \in I</math>.</p>	<p>The only ideals of <math>F</math> are 0 and <math>F</math>, both of which are finitely generated by 0 and 1, respectively. Thus <math>F</math> is Noetherian. Since the polynomial ring formed by adjoining one indeterminate to a Noetherian ring is also Noetherian, we know <math>F[x_1]</math> is Noetherian. By induction, <math>F[x_1, \dots, x_n]</math> is Noetherian.</p>
<p>False. Consider <math>\mathbb{Z}[x]</math> as a <math>\mathbb{Z}</math>-module. <math>\mathbb{Z}[x]</math> can be generated by 1, but the ideal/submodule <math>(2, x)</math> cannot be generated by fewer than 2 generators.</p> <p>This is one of the reasons that modules suck.</p>	<p>False. Every ring with identity is finitely generated as an <math>R</math>-module over itself by the identity. But if its ideals are not finitely generated, then the submodules are non-finitely generated submodules. To be more specific, consider <math>\mathbb{R}[x_1, x_2, \dots]</math>, the polynomial ring over the reals with countably many indeterminates. The ring is itself generated by 1, but the ideal <math>I = (x_1, x_2, \dots)</math> cannot be finitely generated.</p>
<p>Let <math>R</math> be a ring and <math>M</math> an <math>R</math>-module. An <math>R</math>-submodule of <math>M</math> is a subgroup <math>N</math> of <math>M</math> such that for all <math>r \in R, n \in N</math>, we have <math>rn \in N</math> (i.e. closed under the action of ring elements).</p>	<p>Let <math>R</math> be a ring. A <i>left <math>R</math>-module</i> is an abelian group <math>(M, +)</math> together with an action of <math>R</math> on <math>M</math> such that for all <math>r, s \in R</math> and <math>m, n \in M</math>,</p> <ul style="list-style-type: none"> <li>• <math>(r+s)m = rm + sm</math></li> <li>• <math>(rs)m = r(sm)</math></li> <li>• <math>r(m+n) = rm + rn</math></li> </ul> <p>If <math>R</math> has 1, we also require that <math>1m = m</math>. Then <math>M</math> will be a <i>unital module</i>.</p>

<p>MODULES</p> <p><i>What is the <u>free module of rank <math>n</math> over <math>R</math></u>?</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>What kind of module is the same as an abelian group?</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>If <math>F</math> is a field, what is an <math>F[x]</math>-module?</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>Let <math>F</math> be a field, <math>V</math> a vector space, and <math>T</math> a linear transformation from <math>V</math> to <math>V</math>. What are the submodules of the <math>F[x]</math>-module <math>V</math>?</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>State the submodule criterion.</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>Let <math>R</math> be a ring. What is an <u><math>R</math>-module homomorphism</u>?</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>Let <math>R</math> be a ring and <math>M, N</math> be <math>R</math>-modules. What is <math>\text{Hom}_R(M, N)</math>?</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>Let <math>R</math> be a ring and <math>M, N</math> be <math>R</math>-modules. Under what ring action is <math>\text{Hom}_R(M, N)</math> also an <math>R</math>-module?</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>True or False: Let <math>R</math> be a ring and <math>M</math> be an <math>R</math>-module. Then for any submodule <math>N</math> of <math>M</math>, we can form a quotient module <math>M/N</math>. Give a proof or counterexample.</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>Let <math>A, B</math> be submodules of the <math>R</math>-module <math>M</math>. What is the smallest module that contains both <math>A</math> and <math>B</math>?</i></p> <p>ALGEBRA PRELIM</p>

<p>Any <math>\mathbb{Z}</math>-module is exactly an abelian group. <math>\mathbb{Z}</math>-submodules are subgroups.</p>	<p>Let <math>R</math> be a unital ring and let <math>n</math> be a positive integer. The <i>free module of rank <math>n</math> over <math>R</math></i> is</p> $R^n = \{(a_1, a_2, \dots, a_n) \mid a_i \in R\}$ <p>as a module over <math>R</math> with componentwise addition and multiplication.</p>
<p>The submodules of <math>V</math> are subspaces <math>U</math> such that the action of <math>T</math> is contained in <math>U</math>. Thus subspaces of <math>V</math> that are <math>T</math>-stable are <math>F[x]</math>-submodules.</p>	<p>Let <math>T</math> be a linear transformation from vector space <math>V</math> to <math>V</math>. Then an <math>F[x]</math>-<i>module</i> is the vector space <math>V</math> under the action of polynomials from <math>F[x]</math>. The action is of a polynomial <math>p(x) \in F[x]</math> is the linear transformation <math>p(T)</math>.</p> <p>There is a bijection between pairs <math>V, T</math> and <math>F[x]</math>-modules over <math>V</math>.</p>
<p>Let <math>M, N</math> be <math>R</math>-modules. A map <math>\varphi : M \rightarrow N</math> is an <math>R</math>-<i>module homomorphism</i> if for all <math>x, y \in M, r \in R</math></p> $\varphi(x + ry) = \varphi(x) + r\varphi(y)$	<p>Let <math>R</math> be a ring and <math>M</math> an <math>R</math>-<i>module</i>. A subset <math>N</math> of <math>M</math> is submodule of <math>M</math> if and only if</p> <ol style="list-style-type: none"> <li>1. <math>N \neq \emptyset</math>, and</li> <li>2. <math>x + ry \in N</math> for all <math>r \in R, x, y \in N</math></li> </ol>
<p>Let <math>r \in R</math> and <math>\varphi \in \text{Hom}_R(M, N)</math>. Let the action of <math>r</math> on <math>\varphi</math> be <math>(r\varphi)(m) = r(\varphi(m))</math> for all <math>m \in M</math>. Under this action, <math>\text{Hom}_R(M, N)</math> is an <math>R</math>-module.</p>	<p><math>\text{Hom}_R(M, N)</math> is the set of all <math>R</math>-module homomorphisms from <math>M</math> into <math>N</math>.</p>
<p>The smallest module that contains <math>A</math> and <math>B</math> is the sum, <math>A + B = \{a + b \mid a \in A, b \in B\}</math>.</p> <p>Note that we use the <i>sum</i> and not the product because we are combining groups, so we combine using the group operation.</p>	<p>True.</p> <p>Since <math>M</math> is an abelian group, <math>N</math> is normal so <math>M/N</math> is a group. Then define the action of <math>R</math> on <math>M/N</math> so that for <math>r \in R, x + N \in M/N</math>,</p> $r(x + N) = (rx) + N.$ <p>Then we can verify that this is a proper <math>R</math>-module.</p>

<p>MODULES</p> <p><i>Let <math>M</math> be an <math>R</math>-module and let <math>A</math> be a subset of <math>M</math>. What is the definition of <math>RA</math>, the <u>submodule generated by <math>A</math></u>?</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>Let <math>M</math> be an <math>R</math>-module and <math>N</math> a submodule of <math>M</math>. What does it mean for <math>N</math> to be <u>cyclic</u>?</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>True or False: Let <math>M</math> be an <math>R</math>-module and <math>N</math> a submodule of <math>M</math>. Then <math>N</math> has a minimal generating set. Give a proof or counterexample.</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>True or False: Let <math>M</math> be an <math>R</math>-module and <math>N</math> a submodule of <math>M</math>. If <math>N</math> has a minimal generating set, then that minimal generating set is unique. Give a proof or counterexample.</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>True or False: A submodule of a finitely generated <math>R</math>-module is also finitely generated. Give a proof or counterexample.</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>What is the <u>direct product</u> of a finite number of <math>R</math>-modules? What is the <u>external direct sum</u> of a finite number of <math>R</math>-modules?</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>What is the <u>direct product</u> of an infinite number of <math>R</math>-modules? What is the <u>direct sum</u> of an infinite number of <math>R</math>-modules?</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>Let <math>N_1, N_2, \dots, N_k</math> be submodules of the <math>R</math>-module <math>M</math>. Suppose the map <math>\pi : N_1 \times \dots \times N_k \rightarrow N_1 + \dots + N_k</math> defined by <math>\pi(n_1, \dots, n_k) = n_1 + \dots + n_k</math> is an isomorphism of <math>R</math>-modules. State three other equivalent characterizations of this isomorphism.</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>What is a <u>free <math>R</math>-module</u>?</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>Clearly state the difference between the uniqueness property of direct sums and the uniqueness property of free modules.</i></p> <p>ALGEBRA PRELIM</p>

<p>A submodule is cyclic if it is finitely generated by exactly 1 element of <math>M</math>, i.e. <math>N = Ra</math> for some <math>a \in N</math>.</p>	$RA = \{r_1a_1 + \cdots + r_ma_m \mid r_i \in R, a_i \in A, i \in 1, \dots, m\}$ <p>In other words, <math>RA</math> is the set of all finite <math>R</math>-linear combinations of the elements of <math>A</math>.</p>
<p>False.</p> <p>If <math>R</math> is a field, then <math>M</math> is a vector space. A minimal generating set for a vector space is a basis, and we know that there are multiple bases that can generate the vector space.</p>	<p>False.</p> <p>If <math>N</math> is finitely generated, then it has a minimal generating set (not necessarily unique).</p> <p><math>\mathbb{Q}</math> as a <math>\mathbb{Z}</math>-module has no minimal generating set.</p>
<p>Let <math>M_1, \dots, M_k</math> be a collection of <math>R</math>-modules. Then the <math>k</math>-tuples <math>(m_1, m_2, \dots, m_k)</math> where <math>m_i \in M_i</math> with addition and action of <math>R</math> defined componentwise is the <i>direct product</i> of <math>M_1, \dots, M_k</math>, denoted <math>M_1 \times \cdots \times M_k</math>.</p> <p>The <i>external direct sum</i> is the same thing but is infuriatingly denoted <math>M_1 \oplus \cdots \oplus M_k</math></p>	<p>False.</p> <p>Let <math>F</math> be a field and let <math>R = F[x_1, x_2, \dots]</math>, the ring of polynomials in infinitely many variables. Let <math>R</math> be an <math>R</math>-module over itself. Then <math>R</math> is finitely generated by 1 but the submodule generated by <math>\{x_1, x_2, \dots\}</math> is not finitely generated.</p>
<ol style="list-style-type: none"> <li>1. <math>M</math> is the direct sum of <math>N_1, \dots, N_k</math>.</li> <li>2. <math>N_j \cap (N_1 + \cdots + N_{j-1} + N_{j+1} + \cdots + N_k) = 0</math> for all <math>j \in \{1, \dots, k\}</math>.</li> <li>3. Every <math>x \in N_1 + \cdots + N_k</math> can be written uniquely in the form <math>n_1 + \cdots + n_k</math> with <math>n_i \in N_i</math>.</li> </ol>	<p>Let <math>I</math> be a nonempty index set and for each <math>i \in I</math>, let <math>M_i</math> be an <math>R</math>-module. The <i>direct product</i> is their direct product as abelian groups with the action of <math>R</math> as componentwise multiplication.</p> <p>The <i>direct sum</i> is the submodule of the direct product where only finitely many of the components <math>m_i</math> are nonzero.</p>
<p>In a direct sum, each element can uniquely be written as a sum of module elements.</p> <p>In a free module, each element can be uniquely written as an <math>R</math>-linear combination of some generating set (i.e. basis).</p>	<p>An <math>R</math>-module <math>F</math> is <i>free</i> on the subset <math>A</math> of <math>F</math> if for every nonzero element <math>x \in F</math>, there are unique nonzero elements <math>r_1, \dots, r_n \in R</math> and unique <math>a_1, \dots, a_n \in A</math> such that <math>x = r_1a_1 + \cdots + r_na_n</math>.</p> <p>Another way of describing this is to say that <math>A</math> is a basis for <math>F</math>.</p>

<p>MODULES</p> <p>What is the universal property of free modules?</p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p>True or False: If <math>F_1</math> and <math>F_2</math> are free <math>R</math>-modules on the same set <math>A</math>, then there is a unique isomorphism between <math>F_1</math> and <math>F_2</math> which is the identity map on <math>A</math>. Give a proof or counterexample.</p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p>Let <math>R</math> be an integral domain and let <math>M</math> be a free <math>R</math>-module of finite rank <math>n</math>. Prove that any <math>n + 1</math> elements of <math>M</math> are <math>R</math>-linearly dependent.</p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p>Let <math>R</math> a ring and <math>M</math> an <math>R</math>-module. What does it mean for <math>M</math> to be a <u>torsion module</u>?</p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p>Let <math>R</math> a ring and <math>M</math> an <math>R</math>-module. What does it mean for <math>M</math> to be <u>torsion-free</u>?</p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p>Let <math>R</math> an integral domain and <math>M</math> an <math>R</math>-module. What is the <u>torsion submodule</u> denoted <math>\text{Tor}(M)</math>?</p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p>Let <math>R</math> be a ring, <math>M</math> be an <math>R</math>-module, and <math>N</math> a submodule of <math>M</math>. What is the <u>annihilator</u> of <math>N</math>?</p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p>True or False: If <math>M</math> is an <math>R</math>-module for some ring <math>R</math> and <math>N, L</math> are submodules, then <math>N \subseteq L</math> implies <math>\text{Ann } N \subseteq \text{Ann } L</math>.</p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p>Let <math>R</math> be an integral domain. What is the <u>rank</u> of an <math>R</math>-module <math>M</math>?</p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p>True or False: Let <math>R</math> be an integral domain, <math>M</math> a finitely generated <math>R</math>-module, and <math>N</math> a submodule of <math>M</math>. Then the rank of <math>M</math> is greater than or equal to the rank of <math>N</math>.</p> <p>ALGEBRA PRELIM</p>

<p>True.</p> <p><i>Proof sketch:</i> <math>F_1</math> and <math>F_2</math> are both a bunch of copies of <math>R</math> indexed by the elements of <math>A</math>, so just map any copy of <math>R</math> to another copy of <math>R</math>.</p>	<p>Let <math>A</math> be a set, <math>R</math> a ring, and <math>F(A)</math> the free <math>R</math>-module on the set <math>A</math>. If <math>M</math> is any <math>R</math>-module and <math>\varphi : A \rightarrow M</math> is a set map, there is a unique <math>R</math>-module homomorphism <math>\psi : F(A) \rightarrow M</math> such that <math>\psi(A) = \varphi(A)</math>.</p> <pre>     A  -----&gt;  F(A)      \                  \  phi         psi      \                  \           v      \           M   </pre>
<p><math>M</math> is a torsion module if for every <math>m \in M</math>, there exists <math>r \in R</math> such that <math>r</math> is not a zero divisor and <math>r</math> annihilates <math>m</math>, i.e. <math>rm = 0</math>. In other words, every element of <math>M</math> is a torsion element.</p>	<p>Let <math>x_1, \dots, x_{n+1} \in M</math> be our set of <math>n + 1</math> elements.</p> <p><math>R</math> is an integral domain, so embed it in its field of fractions <math>F</math>. Because <math>M \cong R^n</math>, we know <math>M \subseteq F^n</math>. Since <math>F^n</math> is an <math>n</math>-dimensional vector space, the <math>n + 1</math> elements are <math>F</math>-linearly dependent so there exists linear dependence relation with <math>f_1, \dots, f_{n+1} \in F</math> not all zero such that <math>f_1 x_1 + \dots + f_{n+1} x_{n+1} = 0</math>. We can obtain an <math>R</math>-linear dependence relation by clearing the denominators.</p>
<p>The <i>torsion submodule</i> <math>\text{Tor}(M)</math> is the set of all torsion elements of <math>M</math>.</p> <p><i>Note:</i> If <math>R</math> is not commutative, <math>\text{Tor}(M)</math> may fail to be a submodule.</p>	<p><math>M</math> is torsion free if for <math>m \in M</math> and <math>r \in R</math> where <math>r</math> is not a zero divisor, <math>rm = 0</math> implies that <math>m = 0</math>. In other words, the only torsion element of <math>M</math> is <math>0</math>.</p>
<p>False.</p> <p><math>\text{Ann}(L) \subseteq \text{Ann}(N)</math></p>	<p>The <i>annihilator</i> of <math>N</math> is the ideal of <math>R</math> defined by</p> $\text{Ann}(N) = \{r \in R \mid rn = 0 \text{ for all } n \in N\}$
<p>False. Consider <math>\mathbb{Z}[x]</math> as a module over itself. Then its rank is one while the rank of its submodule <math>(2, x)</math> is two.</p>	<p>The <i>rank</i> of <math>M</math> is the maximum number of <math>R</math>-linearly independent elements of <math>M</math>.</p>

<p>MODULES</p> <p><i>State the structure theorem for modules over PIDs in invariant factor form.</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>State the structure theorem for modules over PIDs in elementary divisor form.</i></p> <p>ALGEBRA PRELIM</p>

Give a proof or counterexample.</i></p> <p>ALGEBRA PRELIM</p>

<p>Let <math>R</math> be a PID and <math>M</math> a finitely generated <math>R</math>-module. Then <math>M</math> is the direct sum of a finite number of cyclic modules whose annihilators are either (0) or generated by powers of primes in <math>R</math>, i.e.</p> $M \cong R^n \oplus R/(p_1^{\alpha_1}) \oplus R/(p_2^{\alpha_2}) \oplus \cdots \oplus R/(p_i^{\alpha_i})$ <p>where <math>n</math> is a nonnegative integer and <math>p_i^{\alpha_i}</math> are positive powers of not-necessarily-distinct primes in <math>R</math>.</p>	<p>Let <math>R</math> be a PID and <math>M</math> a finitely generated <math>R</math>-module. Then</p> <ol style="list-style-type: none"> <li><math>M \cong R^n \oplus R/(a_1) \oplus R/(a_2) \oplus \cdots \oplus R/(a_m)</math> where <math>a_i \in R</math> nonzero and <math>a_1 \mid a_2 \mid \cdots \mid a_m</math>.</li> <li><math>M</math> is torsion-free if and only if <math>M</math> is free.</li> <li><math>\text{Tor}(M) \cong R/(a_1) \oplus R/(a_2) \oplus \cdots \oplus R/(a_m)</math></li> </ol>
<p>True.</p> <p>Let <math>M</math> be the aforementioned torsion module. By the structure theorem for modules over PIDs (elementary divisor form), the fact that <math>M</math> is torsion means that its free rank is zero. Then the structure theorem states exactly this - that <math>M</math> is isomorphic to a direct sum of its <math>p</math>-primary components.</p>	<p><math>p_i</math>-primary component of <math>M</math></p> $= \{x \in M : xp_i^\alpha = 0 \text{ where } \alpha > 0\}$
<p>Let <math>R</math> be a commutative ring. An <math>R</math>-algebra is an <math>R</math>-module <math>M</math> together with binary multiplication <math>M \times M \rightarrow M</math> (called <math>M</math>-multiplication) satisfying</p> <ul style="list-style-type: none"> <li><math>[\alpha x + \beta y, z] = \alpha[x, z] + \beta[y, z]</math></li> <li><math>[z, \alpha x + \beta y] = \alpha[z, x] + \beta[z, y]</math></li> </ul> <p>for all scalars <math>\alpha, \beta \in R</math> and all elements <math>x, y, z \in A</math>.</p>	<p>We will proceed by seeking a <math>R</math>-module homomorphism <math>\varphi : R^n \rightarrow (R/(p))^n</math> with kernel <math>pM</math>.</p> <p>Take <math>(a_1, \dots, a_n) \in R^n</math> and let <math>\varphi((a_1, \dots, a_n)) = (a_1 \text{ mod } (p), \dots, a_n \text{ mod } (p))</math>. This map is clearly surjective. The kernel is the set of elements whose every component are multiples of <math>p</math>, or in other words, <math>pR^n</math>. Thus <math>M/pM = R^n/pR^n \cong (R/(p))^n = F^n</math>.</p>
<p>A module over a PID has a decomposition based on the Structure Theorem for Modules over PIDs.</p>	<p>Any <math>R</math>-algebra is an <math>R</math>-module by simply forgetting the multiplicative structure of that <math>R</math>-algebra.</p>
<p>False.</p> <p>Let <math>\mathbb{Z}/n\mathbb{Z}</math> be a <math>\mathbb{Z}</math>-module. This module cannot have a basis because no element is linearly independent, i.e. every element can be multiplied by an appropriate nonzero element of <math>\mathbb{Z}</math> to reach 0. So <math>1 \in \mathbb{Z}/n\mathbb{Z}</math> is a minimal spanning set, yet it fails to be a basis.</p>	<p>True.</p> <p>Since <math>F</math> is a field, <math>F[x]</math> is a PID. By the Structure Theorem for Modules over PIDs, a free <math>F[x]</math>-module is isomorphic to a direct sum of copies of <math>F[x]</math>.</p>

<p>MODULES</p> <p><i>True or False: Let <math>R</math> be a ring and <math>M</math> an <math>R</math>-module with a finite basis. Then every spanning set in <math>M</math> contains a basis and every linearly independent set in <math>M</math> is contained in a basis.</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>Give an example of a free module with a submodule that is not free.</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>True or False: If <math>M</math> is an <math>R</math>-module for some ring <math>R</math>, then <math>M</math> is a free <math>R</math>-module if and only if <math>M</math> has a basis.</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>For what kind of <math>R</math>-module is it true that we can uniquely define an <math>R</math>-module homomorphism by specifying the values that the elements of a basis map to?</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>Give an example of a quotient of a free module that is not free.</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>Give an example of an <math>R</math>-module that cannot be expressed as a direct sum of its submodules.</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>Let <math>M</math> be an <math>R</math>-module for some ring <math>R</math> and let <math>N, P</math> be submodules. Prove that if <math>M = N \oplus P</math>, then <math>P \cong M/N</math>.</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>Let <math>M</math> be an <math>R</math>-module for some ring <math>R</math>. What condition needs to be placed on <math>R</math> to guarantee that any two bases of <math>M</math> have the same cardinality and the cardinality of a spanning set is greater than or equal to that of a basis?</i></p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p><i>Complete the sentence: Let <math>R</math> be a commutative ring with identity. Then two <math>R</math>-modules have the same rank if and only if _____.</i></p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p><i>Let <math>R</math> be a PID and let <math>M</math> be a cyclic <math>R</math>-module. Let <math>\text{Ann}(M)</math> be the annihilator of <math>M</math>. Prove that <math>M \cong R/\text{Ann}(M)</math>.</i></p> <p>ALGEBRA PRELIM</p>

<p>The set <math>\mathbb{Z} \times \mathbb{Z}</math> is a free module over itself using componentwise multiplication. We know it is free because the singleton set <math>\{(1, 1)\}</math> serves as a basis.</p> <p>The submodule <math>\mathbb{Z} \times \{0\}</math> is a proper submodule that is not free. We know it is not free because no elements are linearly independent. Any <math>(a, 0)</math> is torsion because multiplying by nonzero element <math>(0, b)</math> will result in <math>(0, 0)</math>.</p>	<p>False.</p>
<p>This is true for free <math>R</math>-modules.</p> <p>Only free <math>R</math>-modules have bases anyway!</p>	<p>True.</p>
<p><math>\mathbb{Z}</math> is a module over itself. Its submodules are the ideals of the ring <math>\mathbb{Z}</math>. These are <math>n\mathbb{Z}</math> for <math>n \in \mathbb{Z}</math>.</p> <p>Given any two submodules <math>n\mathbb{Z}</math> and <math>m\mathbb{Z}</math>, we know that their intersection is nontrivial. In fact, their intersection is <math>k\mathbb{Z}</math> where <math>k = \text{lcm}(n, m)</math>. Since there are no submodules that intersect only trivially, this module cannot be expressed as a direct sum.</p>	<p><math>\mathbb{Z}</math> is a free module over itself because its basis is the set <math>\{1\}</math>. <math>n\mathbb{Z}</math> is a proper submodule that is also free because its basis is the set <math>\{n\}</math>. But <math>\mathbb{Z}/n\mathbb{Z}</math> is not a free <math>\mathbb{Z}</math>-module because not even a single element is linearly independent.</p>
<p><math>R</math> needs to be a commutative ring with identity.</p>	<p>Let <math>\pi</math> be the canonical projection <math>\pi : M \rightarrow P</math>. Then by the first isomorphism theorem, <math>M/N \cong P</math>.</p>
<p>Define the multiplication map <math>\varphi</math> such that for <math>r \in R, m \in M</math>, <math>\varphi(r) = rm</math>. This is an <math>R</math>-module homomorphism. The map is surjective since <math>M</math> is cyclic. The kernel of this map is the set of elements in <math>R</math> that map every element of <math>M</math> to zero - in other words, <math>\text{Ann}(M)</math>. Thus by the first isomorphism theorem, <math>R/\text{Ann}(M) \cong M</math>.</p>	<p>they are isomorphic</p>

<p>MODULES</p> <p>What condition on a ring <math>R</math> guarantees that any submodule of a free <math>R</math>-module is also free?</p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p>True or False: Let <math>M</math> be a free module over <math>R</math> and let <math>N</math> be a submodule of <math>M</math>. Then any basis for <math>N</math> can be extended to form a basis for <math>M</math>. Give a proof or counterexample.</p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p>Let <math>R</math> be a PID, <math>M</math> a free <math>R</math>-module, and <math>N</math> a submodule. What is the closest analogue to the vector space property that there is a basis for <math>M</math> containing a basis for <math>N</math>?</p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p>True or False: Any free module over an integral domain is torsion-free. Give a proof or counterexample.</p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p>Complete the sentence: A finitely-generated module over a PID is a free module if and only if it is _____.</p> <p>ALGEBRA PRELIM</p>	<p>MODULES</p> <p>Complete the sentence: Any _____ module over a PID <math>R</math> is the direct sum of a finitely generated free <math>R</math>-module and a finitely generated torsion <math>R</math>-module</p> <p>ALGEBRA PRELIM</p>
<p>MODULES</p> <p>Let <math>R</math> be a PID and <math>M</math> a finitely generated <math>R</math>-module so that <math>M \cong M_{\text{free}} \oplus M_{\text{tor}}</math>. True or False: (1) <math>M_{\text{free}}</math> is unique. (2) <math>M_{\text{tor}}</math> is unique.</p> <p>ALGEBRA PRELIM</p>	<p>LINEAR ALGEBRA</p> <p>When does a matrix admit an LU decomposition into lower and upper triangular matrices?</p> <p>ALGEBRA PRELIM</p>
<p>LINEAR ALGEBRA</p> <p>What are the vector space axioms for a vector space <math>V</math> over a field <math>F</math>?</p> <p>ALGEBRA PRELIM</p>	<p>LINEAR ALGEBRA</p> <p>Fill in the blank: Each conjugacy class of _____ is represented by exactly one matrix in rational canonical form</p> <p>ALGEBRA PRELIM</p>

<p>False.</p> <p><math>\mathbb{Z}</math> is a module over itself and <math>2\mathbb{Z}</math> is a submodule. The set <math>\{2\}</math> is a basis for <math>2\mathbb{Z}</math>, but it cannot be extended to a basis for <math>\mathbb{Z}</math>.</p>	<p><math>R</math> is a PID.</p>
<p>True.</p> <p>A free module of rank <math>n</math> over <math>R</math> where <math>R</math> is an integral domain is isomorphic to <math>R^n</math>. Since <math>R</math> is an integral domain, its action on <math>R^n</math> (<math>n</math> copies of itself) must be torsion-free.</p>	<p>Let <math>M</math> be of rank <math>n</math> and let <math>N</math> be of rank <math>k \leq n</math>. Then there is a basis <math>\mathcal{B}</math> for <math>M</math> that contains a subset <math>S = \{v_1, \dots, v_k\}</math> for which <math>\{r_1 v_1, \dots, r_k v_k\}</math>, <math>r_i \in R</math> nonzero, is a basis for <math>N</math>. The elements <math>r_i</math> satisfy the divisibility relations <math>r_1 \mid r_2 \mid \dots \mid r_k</math></p>
<p>finitely generated</p>	<p>torsion-free</p>
<p>An invertible matrix admits an <math>LU</math> decomposition if and only if all of its leading principal minors are nonsingular, i.e. all of the <math>(n-1) \times (n-1)</math> minors are nonsingular.</p>	<ol style="list-style-type: none"> <li>1. How does one find the characteristic polynomial of <math>T</math>?</i></p> <p>ALGEBRA PRELIM</p>	<p>LINEAR ALGEBRA</p> <p><i>What is the significance of the roots of the characteristic polynomial?</i></p> <p>ALGEBRA PRELIM</p>
<p>LINEAR ALGEBRA</p> <p><i>What is the <u>minimal polynomial</u> of a matrix <math>A</math>?</i></p> <p>ALGEBRA PRELIM</p>	<p>LINEAR ALGEBRA</p> <p><i>Explain the fact that the rational canonical form of a matrix <math>A</math> is based on an invariant factor decomposition of the finite-dimensional vector space <math>V</math>.</i></p> <p>ALGEBRA PRELIM</p>
<p>LINEAR ALGEBRA</p> <p><i>True or False: The minimal polynomial is the smallest invariant factor of vector space <math>V</math>.</i></p> <p>ALGEBRA PRELIM</p>	<p>LINEAR ALGEBRA</p> <p><i>Given an invariant factor <math>a(x) = x^n + b_{n-1}x^{n-1} + \cdots + b_1x + b_0</math>, what is the companion matrix generated by this invariant factor?</i></p> <p>ALGEBRA PRELIM</p>
<p>LINEAR ALGEBRA</p> <p><i>Let <math>C_i</math> be the companion matrix calculated from invariant factor <math>a_i(x)</math> and let the invariant factors satisfy <math>a_1(x) \mid a_2(x) \mid \cdots \mid a_m(x)</math>. How do we form the rational canonical form from these companion matrices?</i></p> <p>ALGEBRA PRELIM</p>	<p>LINEAR ALGEBRA</p> <p><i>True or False: Let <math>S, T</math> be linear transformations of <math>V</math>. Then <math>S, T</math> are similar if and only if they share the same rational canonical form.</i></p> <p>ALGEBRA PRELIM</p>

<p><math>\det(T) =</math> the product along the diagonal</p>	<p>True. Every subspace has a complement.</p> <p>Let <math>B_W</math> be a basis for <math>W</math>. We can extend it to form a basis for <math>V</math>. Let this basis for <math>V</math> be called <math>B_V</math>. Then <math>U</math> is the span of <math>B_V \setminus B_W</math>. By the construction of <math>B_V</math>, it is clear that <math>V = W \oplus U</math>.</p>
<p>They are eigenvalues.</p>	<p>The characteristic polynomial is <math>\det(xI - T)</math>.</p>
<p>Given a particular matrix <math>A</math>, <math>V</math> is an <math>F[x]</math>-module. Since <math>F[x]</math> is a PID (actually it's Euclidean), we can use the structure theorem for modules over PIDs. Then</p> $V \cong F[x]/(a_1(x)) \oplus F[x]/(a_2(x)) \oplus \cdots \oplus F[x]/(a_m(x))$ <p>where the generators of the quotienting ideals are invariant factors.</p>	<p>The <i>minimal polynomial</i> <math>m(x)</math> is the unique monic polynomial of lowest degree such that <math>m(A) = 0</math> (the zero operator)</p>
$\begin{pmatrix} 0 & 0 & \cdots & \cdots & \cdots & -b_0 \\ 1 & 0 & \cdots & \cdots & \cdots & -b_1 \\ 0 & 1 & \cdots & \cdots & \cdots & -b_2 \\ 0 & 0 & \ddots & & & \vdots \\ \vdots & \vdots & & \ddots & & \vdots \\ 0 & 0 & \cdots & \cdots & 1 & -b_{n-1} \end{pmatrix}$	<p>False.</p> <p>It is the largest invariant factor. All other invariant factors must divide it.</p>
<p>True.</p>	$\begin{pmatrix} C_1 & & & \\ & C_2 & & \\ & & \ddots & \\ & & & C_m \end{pmatrix}$

<p>LINEAR ALGEBRA</p> <p><i>True or False: Let <math>A</math> be an <math>n \times n</math> matrix over field <math>F</math> and let <math>K</math> be an extension of <math>F</math>. Then the rational canonical forms of <math>A</math> over <math>K</math> and over <math>F</math> are the same.</i></p> <p>ALGEBRA PRELIM</p>	<p>LINEAR ALGEBRA</p> <p><i>What is an <u><math>n \times n</math> Jordan block for eigenvalue <math>\lambda</math></u>?</i></p> <p>ALGEBRA PRELIM</p>
<p>LINEAR ALGEBRA</p> <p><i>Complete the sentence: A matrix is diagonalizable if and only if its Jordan canonical form is _____ .</i></p> <p>ALGEBRA PRELIM</p>	<p>LINEAR ALGEBRA</p> <p><i>In what sense is the Jordan canonical form of a matrix unique?</i></p> <p>ALGEBRA PRELIM</p>
<p>LINEAR ALGEBRA</p> <p><i>What does it mean for a matrix to be in <u>Jordan canonical form</u>?</i></p> <p>ALGEBRA PRELIM</p>	<p>LINEAR ALGEBRA</p> <p><i>True or False: Two diagonal matrices are similar if and only if their diagonal entries are the same up to a permutation.</i></p> <p>ALGEBRA PRELIM</p>
<p>LINEAR ALGEBRA</p> <p><i>A matrix <math>M</math> is diagonalizable if and only if what condition is placed on its minimal polynomial? Give a proof.</i></p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p><i>In what fields does that quadratic formula apply?</i></p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p><i>Let <math>L/F</math> be a finite extension of fields. For <math>\alpha \in L</math>, left multiplication by <math>\alpha</math> is an <math>F</math>-linear transformation of <math>F</math>. What is the relationship between the field norm of <math>\alpha</math> and this linear transformation induced by <math>\alpha</math>?</i></p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p><i>Let <math>L/F</math> be a finite extension of fields. For <math>\alpha \in L</math>, what is the field norm <math>N_{L/F}(\alpha)</math>?</i></p> <p>ALGEBRA PRELIM</p>

$\begin{pmatrix} \lambda & 1 & & & \\ & \lambda & \ddots & & \\ & & \ddots & 1 & \\ & & & \lambda & 1 \\ & & & & \lambda \end{pmatrix}$	<p>True.</p>
<p>It is unique up to permutation of the Jordan blocks.</p>	<p>diagonal</p>
<p>True.</p> <p>If their diagonal entries are the same up to permutation, then their Jordan canonical forms are the same, which means they are similar.</p>	<p>A matrix is in <i>Jordan canonical form</i> if it is block diagonal and each block is a Jordan block.</p>
<p>The quadratic formula applies in any field that is not of characteristic 2.</p>	<p>Its minimal polynomial <math>m(x)</math> must have no repeated roots.</p> <p>(<math>\Leftarrow</math>) If <math>m(x)</math> has no repeated roots, by the divisibility conditions of invariant factors, the elementary divisors are linear polynomials. Thus the JCF of <math>M</math> is diagonal</p> <p>(<math>\Rightarrow</math>) If <math>M</math> is similar to a diagonal matrix <math>D</math>, then <math>M</math> and <math>D</math> have the same minimal polynomial. The minimal polynomial of <math>D</math> must contain all distinct linear factors, each corresponding to the <math>1 \times 1</math> blocks that make up <math>D</math>.</p>
<p>Let <math>f(x)</math> be the minimal polynomial for <math>\alpha</math> over <math>F</math>. Let <math>\sigma_1(\alpha), \dots, \sigma_n(\alpha)</math> be the roots (counted with multiplicity) of <math>f(x)</math>. Then</p> $N_{L/F}(\alpha) = \left( \prod_{j=1}^n \sigma_j(\alpha) \right)^{[L:F(\alpha)]}$ <p>i.e., it is the product of all Galois conjugates of <math>\alpha</math>. One can also think of it as the constant term of the minimal polynomial times <math>(-1)^n</math> where <math>n</math> is the degree of <math>f(x)</math>.</p>	<p>Let <math>T</math> be the matrix that represents the linear transformation. Then the field norm of <math>\alpha</math> is the determinant of <math>T</math>.</p>

<p>FIELDS</p> <p>Let <math>K/F</math> be a finite extension of fields. For <math>\alpha \in K</math>, left multiplication by <math>\alpha</math> on <math>K</math> is an <math>F</math>-linear transformation <math>T_\alpha</math> of <math>K</math>. <p>FIELDS</p> <p><i>Complete the sentence: The field extension <math>F(\alpha)/F</math> is finite if and only if _____ .</i></p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p><i>What is the <u>tower rule</u> for field extensions?</i></p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p><i>What does it mean for a field extension <math>K/F</math> to be <u>finitely generated</u>?</i></p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p><i>(Artin's Theorem) Complete the sentence: Let <math>K/F</math> be a finite extension. Then <math>K = F(\alpha)</math> for some <math>\alpha \in K</math> if and only if _____ .</i></p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p><i>What condition on field extension <math>K/F</math> guarantees that <math>K = F(\alpha)</math> for some <math>\alpha \in K</math>? What can we say if the base field is of characteristic 0?</i></p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p><i>Suppose <math>\alpha, \beta</math> are algebraic over <math>F</math>. Prove that <math>\alpha \pm \beta, \alpha\beta, \alpha/\beta</math> (<math>\beta \neq 0</math>) are all algebraic over <math>F</math>.</i></p> <p>ALGEBRA PRELIM</p>

<p>False.</p> <p><math>m_{\alpha,K}(x)</math> divides <math>m_{\alpha,F}(x)</math></p>	<p>The minimal polynomial of <math>\alpha</math> divides <math>p(x)</math>.</p>
<p>Let <math>\deg(\alpha) = n</math>. Since <math>F(\alpha) \cong F[x]/(m_{\alpha,F}(x))</math>, we know <math>F(\alpha)</math> can be viewed as polynomials of degree <math>n - 1</math>, which is a vector space of dimension <math>n</math> over <math>F</math>.</p>	<p>The <i>degree</i> of <math>\alpha</math> is the degree of its minimal polynomial.</p>
<p>Let <math>F \subseteq K \subseteq L</math> be fields. Then <math>[L : F] = [L : K][K : F]</math>.</p> <p>Nat calls it “Lagrange’s for fields”</p>	<p><math>\alpha</math> is algebraic over <math>F</math></p>
<p>there exist finitely many intermediate fields</p> <p>(alternatively) if the extension is finite and separable.</p>	<p><math>K/F</math> is finitely generated if there are elements <math>\alpha_1, \alpha_2, \dots, \alpha_k \in K</math> such that <math>K = F(\alpha_1, \alpha_2, \dots, \alpha_k)</math>.</p>
<p>All of these elements lie in <math>\mathbb{F}(\alpha, \beta)/F</math>. Since this extension over <math>F</math> is generated by finitely many algebraic elements, the extension is finite. A finite extension is always algebraic, and thus every above-listed element is algebraic.</p>	<p>The conclusion holds if <math>K/F</math> is a finite separable extension.</p> <p>If the base field is of characteristic zero, then every extension is separable, so any finite extension is a simple extension.</p>

<p>FIELDS</p> <p>If <math>K_1, K_2</math> are subfields of field <math>K</math>, what is the <u>composite field</u> <math>K_1K_2</math>?</p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p>True or False: If <math>K_1, K_2</math> are finite extensions of <math>F</math> contained in <math>K</math>, then <math>[K_1K_2 : F] \leq [K_1 : F][K_2 : F]</math>. Give a proof or counterexample.</p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p>Let <math>K_1, K_2</math> be finite extensions of <math>F</math> contained in <math>K</math>. Let <math>[K_1 : F] = n</math>, <math>[K_2 : F] = m</math>, and <math>(n, m) = 1</math>. Prove that <math>[K_1K_2 : F] = [K_1 : F][K_2 : F]</math>.</p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p>Prove that if <math>[F(\alpha) : F]</math> is odd, then <math>F(\alpha) = F(\alpha^2)</math>.</p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p>Complete the sentence: Let <math>F \subset \mathbb{R}</math>. Then <math>\alpha \in \mathbb{R}</math> can be obtained by compass and straightedge constructions if and only if _____.</p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p>Prove that given a cube, one cannot construct another cube with double the volume by using compass and straightedge constructions.</p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p>Complete the sentence: The regular <math>n</math>-gon is constructible by compass and straightedge constructions if and only if _____.</p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p>What is a <u>Fermat prime</u>?</p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p>What is a <u>splitting field</u>?</p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p>What is a <u>normal extension</u>?</p> <p>ALGEBRA PRELIM</p>

<p>True.</p> <p><math>K_1, K_2</math> are finite extensions, so they are finitely generated. Say <math>K_1 = F(\alpha_1, \dots, \alpha_n)</math> and <math>K_2 = F(\beta_1, \dots, \beta_m)</math>. Then <math>K_1 K_2 = F(\alpha_1, \dots, \alpha_n, \beta_1, \dots, \beta_m) = K_1(\beta_1, \dots, \beta_m)</math>. This means <math>\{\beta_i\}</math> spans <math>K_1 K_2</math> over <math>K_1</math>, so <math>[K_1 K_2 : K_1] \leq m</math>. Then applying the tower rule completes the proof.</p> <p>Note: The inequality becomes an equality if and only if an <math>F</math>-basis for one of the fields remains linearly independent over the other field.</p>	<p><math>K_1 K_2</math> is the smallest subfield of <math>K</math> that contains <math>K_1</math> and <math>K_2</math>.</p>
<p>Clearly <math>F(\alpha^2) \subseteq F(\alpha)</math>. Then <math>[F(\alpha) : F(\alpha^2)][F(\alpha^2) : F]</math> is odd. The minimal polynomial for <math>\alpha</math> over <math>F(\alpha^2)</math> is of degree at most 2 since <math>\alpha</math> is a root of <math>x^2 - \alpha^2</math>.</p> <p>If <math>m_\alpha(x)</math> is of degree 2, then <math>[F(\alpha) : F(\alpha^2)] = 2</math>, which contradicts that <math>[F(\alpha) : F(\alpha^2)][F(\alpha^2) : F]</math> is odd. Thus <math>m_\alpha(x)</math> is of degree 1 and <math>\alpha \in F(\alpha^2)</math>.</p>	<p><math>K_1</math> and <math>K_2</math> are subfields of <math>K_1 K_2</math>, so both <math>n</math> and <math>m</math> divide <math>[K_1 K_2 : F]</math>. Then <math>[K_1 K_2 : F]</math> is divisible by <math>\text{lcm}(n, m) = nm</math>. Finally since it is known that <math>[K_1 K_2 : F] \leq [K_1 : F][K_2 : F]</math>, we conclude <math>[K_1 K_2 : F] = [K_1 : F][K_2 : F]</math>.</p>
<p>Suppose the original cube has side length 1. Then a cube with double the volume has side length <math>\sqrt[3]{2}</math>. This element has degree 3 over <math>\mathbb{Q}</math>, so <math>[\mathbb{Q}(\sqrt[3]{2}) : \mathbb{Q}] \neq 2^k</math> for nonnegative integer <math>k</math>. Thus the cube of doubled volume is not constructible.</p>	<p><math>[F(\alpha) : F] = 2^k</math> for some integer <math>k \geq 0</math></p>
<p>A <i>Fermat prime</i> is a prime number of the form <math>2^{2^n} + 1</math> for nonnegative integer <math>n</math>.</p>	<p><math>n = 2^k p_1 \cdots p_r</math> where <math>k</math> is a nonnegative integer and <math>p_1, \dots, p_r</math> are distinct Fermat primes.</p>
<p>Let <math>K</math> be an algebraic extension of <math>F</math>. If <math>K</math> is the splitting field for some collection of polynomials <math>f(x) \in F[x]</math>, then <math>K</math> is a <i>normal</i> extension.</p>	<p>Let <math>K</math> be an extension of <math>F</math>. Then <math>K</math> is a <i>splitting field</i> for the polynomial <math>f(x) \in F[x]</math> if <math>f(x)</math> factors into linear factors in <math>K[x]</math> and fails to factor completely in any proper subfield of <math>K</math> containing <math>F</math>.</p>

What is the <u>separable degree</u> of <math>f(x)</math>? What is the <u>inseparable degree</u> of <math>f(x)</math>?</i></p> <p>ALGEBRA PRELIM</p>

<p>Let <math>F</math> be a field of characteristic <math>p</math>. The <i>Frobenius endomorphism</i> is the map <math>\varphi : F \rightarrow F</math> such that <math>\varphi(\alpha) = \alpha^p</math>.</p>	<p>Let <math>F</math> be of characteristic zero and <math>p(x) \in F[x]</math> is irreducible of degree <math>n</math>. The only factors of <math>p(x)</math> are 1 and <math>p(x)</math>. The derivative <math>p'(x)</math> has factors of degree at most <math>n - 1</math>. Thus the only factor that <math>p(x)</math> and <math>p'(x)</math> can share is 1. Thus <math>p(x)</math> is separable.</p> <p>In a field of characteristic <math>p</math>, the derivative of <math>x^{pm}</math> is zero, so the degree of the derivative may drop more than 1. However, if <math>p'(x)</math> is nonzero (and <math>p(x)</math> is irreducible as before), then <math>p(x)</math> is separable.</p>
<p>A field <math>K</math> of characteristic <math>p</math> is perfect if every element of <math>K</math> is a <math>p^{\text{th}}</math> power in <math>K</math>. Any field of characteristic 0 is also perfect.</p>	<p>Let <math>\varphi(a) = a^p</math> for <math>a \in F</math> be the Frobenius map. Since <math>\varphi</math> is a map between fields, the map is injective. Also, <math>\varphi</math> maps <math>F</math> to itself so injectivity is enough to prove that <math>\varphi</math> is a bijection.</p>
<p>True.</p>	<p>TFAE:</p> <ul style="list-style-type: none"> <li>• <math>F</math> is perfect</li> <li>• Every irreducible polynomial over <math>F</math> has distinct roots</li> <li>• Every irreducible polynomial over <math>F</math> is separable</li> <li>• Every finite extension of <math>F</math> is separable</li> <li>• Every algebraic extension of <math>F</math> is separable</li> <li>• Either <math>F</math> has characteristic 0 or when <math>F</math> has characteristic <math>p</math>, then every element is a <math>p^{\text{th}}</math> power</li> </ul>
<p>True.</p> <p>A finite field of order <math>p^n</math> is the splitting field over <math>\mathbb{F}_p</math> of the polynomial <math>x^{p^n} - x</math>. All splitting fields are unique up to isomorphism.</p>	<p>perfect</p>
<p>Let <math>f_{sep}(x)</math> be the unique irreducible separable polynomial in <math>F[x]</math> such that <math>f(x) = f_{sep}(x^{p^k})</math>.</p> <p>The <i>separable degree</i> of <math>f(x)</math> is the degree of <math>f_{sep}(x)</math>.</p> <p>The <i>inseparable degree</i> of <math>f(x)</math> is the integer <math>p^k</math>.</p> <p><i>Note:</i> These definitions only make sense for <i>irreducible</i> polynomials!</p>	<p>If <math>f(x)</math> is separable, then <math>f = f_{sep}</math>. If <math>f(x)</math> is not separable, then <math>f'(x) = 0</math> and every power of <math>x</math> in <math>f(x)</math> is a multiple of <math>p</math>. Thus there exists polynomial <math>f_1(x)</math> such that <math>f(x) = f_1(x^p)</math>. Continue this process until <math>f_k(x)</math> is separable (i.e. has nonzero derivative). Such an <math>f_k</math> is clearly irreducible since any factorization of <math>f_k</math> would produce a corresponding factorization of <math>f</math>. This <math>f_k</math> is the <math>f_{sep}</math> we seek.</p>

<p>FIELDS</p> <p>What is a <u>separable</u> field extension?</p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p>What is the <u><math>n^{\text{th}}</math> cyclotomic polynomial <math>\Phi_n(x)</math></u>?</p> <p>ALGEBRA PRELIM</p>

<p>FIELDS</p> <p>True or False: Let <math>K/F</math> be an extension of fields. Then <math>[K : F] \leq  \text{Aut}(K/F) </math>. Give a proof or counterexample.</p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p>What is a <u>Galois</u> extension?</p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p>List five equivalent characterizations of <math>K/F</math> being a Galois extension.</p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p>What is the Galois group of the splitting field of <math>x^3 - 2</math> over <math>\mathbb{Q}</math>?</p> <p>ALGEBRA PRELIM</p>

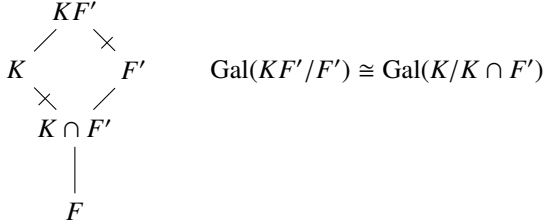

<p>Let <math>\mu_n</math> be the group of <math>n^{\text{th}}</math> roots of unity over <math>\mathbb{Q}</math>.</p> $\Phi_n(x) = \prod_{\zeta \text{ primitive } \in \mu_n} (x - \zeta) = \prod_{\substack{1 \leq a < n \\ (a,n)=1}} (x - \zeta_n^a)$ <p>In other words, it is the polynomial whose roots are exactly the primitive <math>n^{\text{th}}</math> roots of unity.</p>	<p>A field <math>K</math> is <i>separable</i> over <math>F</math> if every element of <math>K</math> is the root of a separable polynomial over <math>F</math>. Equivalently, <math>K</math> is separable if every element of <math>K</math> has a separable minimal polynomial over <math>F</math>.</p>
<p><math>\text{Aut}(K/F)</math> is the group (under composition) of automorphisms of <math>K</math> that fix every element of <math>F</math>.</p>	<p>Notice <math>x^{2n} - 1 = (x^n - 1)(x^n + 1)</math>. Let <math>\zeta</math> be a root of <math>x^n - 1</math>. Then <math>-\zeta</math> is a root of <math>x^n + 1</math>. Thus any field with the <math>n^{\text{th}}</math> roots of unity also contains the <math>2n^{\text{th}}</math> roots of unity.</p> <p>Geometrically, we can see that the set of roots of <math>x^n + 1</math> is a rotation of the roots of <math>x^n - 1</math> by <math>180^\circ</math>.</p>
<p>Let <math>K</math> be a field and let <math>H</math> be a subset of <math>\text{Aut}(K)</math>. Then the <i>fixed field</i> of <math>H</math> is the subfield of <math>K</math> such that <math>H</math> fixes all the elements of this subfield.</p>	<p><math>\sigma(\alpha)</math> is a root of the minimal polynomial of <math>\alpha</math>.</p>
<p>Let <math>K/F</math> be a finite extension. Then <math>K</math> is <i>Galois</i> over <math>F</math> if <math> \text{Aut}(K/F)  = [K : F]</math>. If <math>K/F</math> is Galois, then the group of automorphisms is denoted <math>\text{Gal}(K/F)</math>.</p>	<p>False.</p> <p>Let <math>\alpha = \sqrt[3]{2}</math>. Then <math>[\mathbb{Q}(\alpha) : \mathbb{Q}] = 3</math>, but <math> \text{Aut}(\mathbb{Q}(\alpha)/\mathbb{Q})  = 1</math>. To see this, recall <math>m_\alpha(x) = x^3 - 2</math>. In the splitting field <math>K</math> of <math>m_\alpha(x)</math>, <math>\text{Aut}(K/\mathbb{Q})</math> would shuffle the three roots. But <math>\mathbb{Q}(\alpha)/\mathbb{Q}</math> contains the only real root, so automorphisms that fix the base field can only map <math>\alpha</math> to itself. Hence <math> \text{Aut}(\mathbb{Q}(\alpha)/\mathbb{Q})  = 1</math>.</p>
<p>Let <math>\alpha = \sqrt[3]{2}</math>, <math>\zeta = e^{2\pi i/3}</math>. The splitting field is <math>\mathbb{Q}(\alpha, \zeta)</math>. Then</p> $\begin{aligned} [\mathbb{Q}(\alpha, \zeta) : \mathbb{Q}] &= [\mathbb{Q}(\alpha, \zeta) : \mathbb{Q}(\alpha)][\mathbb{Q}(\alpha) : \mathbb{Q}] \\ &= 2 \cdot 3 \\ &= 6. \end{aligned}$ <p>Since the extension is of degree 6, the Galois group has 6 elements. Our polynomial has 3 roots, so the Galois group must be a subgroup of <math>S_3</math>. By considerations regarding order, the Galois group must be <math>S_3</math>.</p>	<p>TFAE:</p> <ul style="list-style-type: none"> <li>• <math>K/F</math> is Galois</li> <li>• <math> \text{Aut}(K/F)  = [K : F]</math></li> <li>• <math>K</math> is the splitting field over <math>F</math> for a separable polynomial</li> <li>• <math>K/F</math> is algebraic and <math>F</math> is the fixed field of <math>\text{Aut}(K/F)</math></li> <li>• Every irreducible polynomial in <math>F[x]</math> with one root in <math>K</math> splits over <math>K</math> and is separable.</li> <li>• <math>K/F</math> is a normal, separable, and finite extension.</li> </ul>

<p>FIELDS</p> <p><i>True or False: A Galois extension of a Galois extension is also Galois. Give a proof or counterexample.</i></p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p><i>True or False: Any quadratic extension <math>K/F</math> is Galois.</i></p> <p>ALGEBRA PRELIM</p>

Give a proof.</i></p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p><i>Describe one method for recursively producing irreducible polynomials over <math>\mathbb{F}_p</math>.</i></p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p><i>Prove that <math>x^{p^n} - x</math> is the product of all irreducible polynomials over <math>\mathbb{F}_p</math> with degree <math>d</math> dividing <math>n</math>.</i></p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p><i>What is the <u>algebraic closure</u> of <math>\mathbb{F}_p</math>?</i></p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p><i>Suppose <math>K/F</math> is Galois and <math>F'/F</math> is any extension. Prove that <math>KF'/F'</math> is also Galois. What is its Galois group?</i></p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p><i>Complete the formula: Suppose <math>K/F</math> is Galois and <math>F'/F</math> is any extension. Then <math>[KF' : F] = \underline{\hspace{2cm}}</math>.</i></p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p><i>Let <math>K_1, K_2</math> be Galois extensions of a field <math>F</math>. Prove that <math>K_1 \cap K_2</math> is Galois over <math>F</math>.</i></p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p><i>Let <math>K_1, K_2</math> be Galois extensions of <math>F</math>. Is <math>K_1K_2</math> Galois? If so, what is its Galois group?</i></p> <p>ALGEBRA PRELIM</p>

<p>If <math>p = 2</math>, then <math>x^4 + 1 = (x + 1)^4</math> and so it is reducible.</p> <p>If <math>p</math> is odd, note that <math>p^2 - 1</math> is divisible by 8. Thus <math>x^{p^2-1} - 1</math> is divisible by <math>x^8 - 1</math>. Then</p> $x^4 + 1 \mid x^8 - 1 \mid x^{p^2-1} - 1 \mid x^{p^2} - x,$ <p>the last of which generates <math>\mathbb{F}_{p^2}</math>, an extension of degree 2. So any extension generated by a root of <math>x^4 + 1</math> is of degree at most 2, which means it is not irreducible over <math>\mathbb{F}_p</math>.</p>	<p>This is true only when <math>n</math> divides <math>m</math>.</p>
<p><math>x^{p^n} - x</math> is precisely the product of all irreducible polynomials over <math>\mathbb{F}_p</math> of degree <math>d</math> dividing <math>n</math>.</p> <p>For example, say we seek all irreducible degree 6 polynomials over <math>\mathbb{F}_3</math>. Since 1, 2, 3, 6 are the divisors of 6, take <math>x^{3^6} - x</math> and divide by all irreducible polynomials of degrees 1, 2, and 3. The divisors of the quotient are all the irreducible degree 6 polynomials.</p>	<p><math>\mathbb{F}_{p^n}(\alpha)</math> is the splitting field for <math>p(x)</math></p> <p>Let <math>\deg(p(x)) = d</math>. Then <math>[\mathbb{F}_{p^n}(\alpha) : \mathbb{F}_{p^n}] = d</math> and since all finite fields of a particular order are isomorphic, <math>\mathbb{F}_{p^n}(\alpha) \cong \mathbb{F}_{p^{nd}}</math>. Thus <math>\alpha</math> is a root of <math>x^{p^{nd}} - x</math>. Since <math>x^{p^{nd}} - x</math> contains precisely all irreducible polynomials of degree dividing <math>nd</math>, we know <math>p(x) \mid x^{p^{nd}} - x</math> and so all roots of <math>p(x)</math> are in <math>\mathbb{F}_{p^n}(\alpha)</math>.</p>
$\overline{\mathbb{F}_p} = \bigcup_{n \geq 1} \mathbb{F}_{p^n}$	<p>The roots of <math>\mathbb{F}_{p^n}</math> are precisely the roots of <math>x^{p^n} - x</math>. We know that <math>\mathbb{F}_{p^d} \subseteq \mathbb{F}_{p^n}</math> if and only if <math>d \mid n</math>. Extending <math>\mathbb{F}_p</math> to the splitting field of any degree <math>d</math> irreducible polynomial will result in <math>\mathbb{F}_{p^d}</math> since all finite fields of the same size are isomorphic. Thus every minimal polynomial of degree <math>d</math> splits in <math>\mathbb{F}_{p^d}</math>. Grouping together all minimal polynomials of the same degree, we see that their product is <math>x^{p^d} - x</math>.</p>
$[KF' : F] = \frac{[K : F][F' : F]}{[K \cap F' : F]}$	<p><math>K/F</math> is Galois, so <math>\exists</math> separable <math>p(x)</math> such that <math>K</math> is its splitting field. This same polynomial is separable over <math>F'</math>, so its splitting field over <math>F'</math> is <math>KF'</math>. Thus <math>KF'/F'</math> is Galois.</p> <div style="text-align: center;">  </div>
<p>Yes, <math>K_1 K_2</math> is Galois.</p> <p>Its Galois group is isomorphic to the subgroup</p> $H = \{(\sigma, \tau) \mid \sigma _{K_1 \cap K_2} = \tau _{K_1 \cap K_2}\}$ <p>of the direct product <math>\text{Gal}(K_1/F) \times \text{Gal}(K_2/F)</math> consisting of elements whose restrictions to the intersection <math>K_1 \cap K_2</math> are equal.</p>	<p>Recall that an extension is Galois if and only any irreducible polynomial that has at least one root in the extension splits completely in the extension.</p> <p>Let <math>p(x)</math> be irreducible in <math>F[x]</math> with a root <math>\alpha</math> in <math>K_1 \cap K_2</math>. By the above characterization of Galois extensions, all roots of <math>p(x)</math> are in both <math>K_1</math> and <math>K_2</math>. But then all roots of <math>p(x)</math> are in <math>K_1 \cap K_2</math> and so <math>K_1 \cap K_2</math> is Galois.</p>

<p>FIELDS</p> <p>Let <math>G</math> be a finite abelian group. Prove that there is a field <math>K/\mathbb{Q}</math> such that <math>\text{Gal}(K/\mathbb{Q}) \cong G</math>.</p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p>What is the <u>discriminant</u> of a polynomial?</p> <p>ALGEBRA PRELIM</p>

<p>Let <math>L</math> be the Galois closure of <math>K/F</math>. By the Fundamental Theorem of Galois Theory, any intermediate field between <math>K</math> and <math>F</math> corresponds to a subgroup of <math>\text{Gal}(L/F)</math>. Since there are finitely many subgroups, there are also finitely many intermediate fields. By Artin's Theorem, <math>K/F</math> is simple.</p>	<p>The <i>Galois closure</i> is an extension <math>K/F</math> which is Galois over <math>F</math> and is minimal in the sense that in a fixed algebraic closure of <math>K</math>, any other Galois extension of <math>F</math> containing <math>E</math> contains <math>K</math>.</p> <p>Note that the Galois closure is defined for <i>finite separable</i> extensions.</p>
<p>Any finite extension <math>K/F</math> of a field of characteristic 0 is separable. If the extension is finite and separable, we can consider its Galois closure. The corresponding Galois group of this Galois closure has finitely many subgroups and thus <math>K/F</math> has only finitely many intermediate fields. By Artin's Theorem, <math>K/F</math> is simple.</p>	<p>A field extension is <i>separable</i> if the minimal polynomial of every element is separable.</p>
<p>The cyclic group <math>\mathbb{Z}/(p-1)\mathbb{Z}</math>.</p>	<p>Its Galois group is the multiplicative group <math>(\mathbb{Z}/n\mathbb{Z})^\times</math>.</p>
<p>The extension <math>K/F</math> is called <i>abelian</i> if <math>K/F</math> is Galois and <math>\text{Gal}(K/F)</math> is an abelian group.</p>	<p>Note that <math>\zeta_n^{p_2^{\alpha_2} \cdots p_k^{\alpha_k}}</math> is a primitive <math>p_1^{\alpha_1}</math>-th root of unity, so the field <math>\mathbb{Q}(\zeta_{p_1^{\alpha_1}})</math> is a subfield of <math>\mathbb{Q}(\zeta_n)</math>. The same applies to the other prime powers. Their composite field is <math>\mathbb{Q}(\zeta_n)</math> and their intersection is <math>\mathbb{Q}</math>. This means that the Galois group of <math>\mathbb{Q}(\zeta_n)</math> is the direct product of the Galois groups of each of the aforementioned subfields, i.e.</p> $\text{Gal}(\mathbb{Q}(\zeta_n)/\mathbb{Q}) \cong \text{Gal}(\mathbb{Q}(\zeta_{p_1^{\alpha_1}})/\mathbb{Q}) \times \cdots \times \text{Gal}(\mathbb{Q}(\zeta_{p_k^{\alpha_k}})/\mathbb{Q})$
<p>Let <math>x_1, \dots, x_n</math> be the roots of a polynomial. Then the discriminant of the polynomial is <math>D = \prod_{i &lt; j} (x_i - x_j)^2</math></p>	<p>The FTGAG guarantees that <math>G \cong \mathbb{Z}_{n_1} \times \cdots \times \mathbb{Z}_{n_k}</math>. Let <math>p_i</math> be prime such that <math>p_i \equiv 1 \pmod{n_i}</math> (there are infinitely many such primes) for <math>i = 1, \dots, k</math>. Let <math>n = p_1 \cdots p_k</math>. Then <math>(\mathbb{Z}/n\mathbb{Z})^\times \cong \prod_{i=1}^k (\mathbb{Z}/p_i\mathbb{Z})^\times \cong \prod_{i=1}^k \mathbb{Z}/(p_i-1)\mathbb{Z}</math>. Since <math>n_i \mid (p_i-1)</math>, there exists <math>H_i \leq \mathbb{Z}/(p_i-1)\mathbb{Z}</math> such that the quotient by <math>H_i</math> is cyclic of order <math>n_i</math>.</p> <p>By the fundamental theorem of Galois theory, there is a subfield of <math>\mathbb{Q}(\zeta_n)</math> that is Galois over <math>\mathbb{Q}</math> and has <math>G</math> as its Galois group.</p>

<p>FIELDS</p> <p><i>What does it mean if an element <math>\alpha</math> that is algebraic over <math>F</math> can be <u>expressed by radicals</u>?</i></p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p><i>What does it mean for a polynomial <math>f(x) \in F[x]</math> to be <u>solvable by radicals</u>?</i></p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p><i>Complete the sentence: A polynomial <math>f(x)</math> can be solved by radicals if and only if _____.</i></p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p><i>True or False: No quintic polynomial is solvable by radicals. Give a proof or counterexample.</i></p> <p>ALGEBRA PRELIM</p>

<p>The Galois group must be a subgroup of <math>S_3</math> and have order at least 3 since adjoining a single root will already result in an extension of degree 3. If the discriminant is a square of an element of the base field, then the Galois group is <math>A_3</math>, i.e. it's precisely <math>A_3</math>. If the discriminant is not a square, then the Galois group must properly contain <math>A_3</math>, i.e. it's precisely <math>S_3</math>.</p>	<p>The Galois group contains automorphisms that fix the base field, so if <math>\sqrt{D} = \prod_{i &lt; j} (x_i - x_j)</math> is contained in the base field, then any automorphism in the Galois group fixes <math>\sqrt{D}</math>. This means that the number of transpositions of the roots is even, since an odd number of transpositions would change the sign of <math>\sqrt{D}</math>. We conclude that the Galois group is a subgroup of <math>A_n</math> where <math>n</math> is the degree of the polynomial in question.</p>
<p>The transitive subgroups of <math>S_5</math> are <math>S_5</math>, <math>A_5</math>, <math>D_{10}</math>, <math>F_{20}</math>, and <math>\mathbb{Z}/5\mathbb{Z}</math>. These are the only possible Galois groups for an irreducible degree 5 polynomial.</p>	<p>The transitive subgroups of <math>S_4</math> are <math>S_4</math>, <math>A_4</math>, <math>D_8</math>, <math>V_4</math>, and <math>\mathbb{Z}/4\mathbb{Z}</math>. These are the only possible Galois groups for an irreducible degree 4 polynomial.</p>
<p>The minimal polynomial for <math>\sqrt[n]{a}</math> is <math>x^n - a</math>. This polynomial is separable. Since adjoining <math>\sqrt[n]{a}</math> generates the splitting field, the extension is Galois.</p>	<p>An extension <math>K/F</math> is <i>cyclic</i> if it is Galois with a cyclic Galois group.</p>
<p>A polynomial is <i>solvable by radicals</i> if all its roots can be expressed by radicals.</p>	<p>An element <math>\alpha</math> can be <i>expressed by radicals</i> if <math>\alpha</math> is an element of a field <math>K</math> that can be formed by a succession of simple radical extensions</p> $F = K_0 \subset K_1 \subset \dots \subset K_s = K$ <p>where <math>K_{i+1} = K_i(\sqrt[n_i]{a_i})</math> for some <math>a_i \in K_i</math>.</p>
<p>False.</p> <p>This is true if and only if the Galois group of the polynomial is <math>S_5</math> or <math>A_5</math>, which are both not solvable groups. For example, <math>f(x) = x^5 - 6x + 3 \in \mathbb{Q}[x]</math> has Galois group <math>S_5</math> and so it is not solvable by radicals. But <math>g(x) = x^5 - 1</math> contains the 5<sup>th</sup> roots of unity, so this polynomial is solvable by radicals.</p>	<p>its Galois group is a solvable group</p>

<p>FIELDS</p> <p>Let <math>p</math> be a prime not dividing the discriminant <math>D</math> of <math>f(x) \in \mathbb{Z}[x]</math>. What relationship does the Galois group of <math>f(x)</math> over <math>\mathbb{Q}</math> have to the Galois group over <math>\mathbb{F}_p</math> of <math>f(x)</math>?</p> <p>ALGEBRA PRELIM</p>	<p>FIELDS</p> <p>Complete the sentence: An algebraic extension over a field of characteristic 0 is _____.</p> <p>ALGEBRA PRELIM</p>
<p>FIELDS</p> <p>What is the Frobenius map? What is its relation to the Galois group of a finite extension over a finite field?</p> <p>ALGEBRA PRELIM</p>	<p>MISCELLANEOUS</p> <p>State Zorn's lemma.</p> <p>ALGEBRA PRELIM</p>
