EXAM 1: SOME PRACTICE PROBLEMS

1. Prove the following.

Proposition.

(a) If $a, m \in \mathbb{Z}$ and $m|a$, then $m|(an)$ for any $n \in \mathbb{Z}$.

(b) If $a, b, m \in \mathbb{Z}$, and $m|a$ and $m|b$, then $m|(a+b)$ and $m|(a-b)$.

(Use the definition of "|" from your fact sheet.)

2. Use both parts of the previous problem to show that, if $m, a, b, x, y \in \mathbb{Z}$ and $m|a$ and $m|b$, then $m|(ax+by)$.

3. Prove the following.

Proposition. If $a, b, c, d, m \in \mathbb{Z}$, $m|(a-b)$, and $m|(c-d)$, then $m|\big(a+c-(b+d)\big)$. (Use the definition of "|" from your fact sheet.)

4. Prove the following.

Proposition. If $a, b \in \mathbb{Z}$, a is odd, and b is even, then ab is even. (Use the definitions of even and odd integers: an even integer is one of the form $2k$ for some $k \in \mathbb{Z}$; an odd integer is one of the form $2k+1$ for some $k \in \mathbb{Z}$.)

5. Use proof by contrapositive to prove the following.

Proposition. If n^2 is odd, then n is odd. (Use the definitions of even and odd integers: an even integer is one of the form $2k$ for some $k \in \mathbb{Z}$; an odd integer is one of the form $2k+1$ for some $k \in \mathbb{Z}$.)

6. Use proof by contrapositive to prove the following.

Proposition. Let $a, b \in \mathbb{Z}$. If ab is a multiple of 3, then either a or b is a multiple of 3. (Hint: an integer that is *not* a multiple of 3 is of the form $3k+r$ where $k \in \mathbb{Z}$ and r equals either 1 or 2.)

7. Prove that, if $m \in \mathbb{Z}$ is even, then $4|m^2$, and if m is odd, then $4|(m^2-1)$.

8. Prove by contradiction that, if $a, b \in \mathbb{Z}$ are odd, then there does not exist $c \in \mathbb{Z}$ with $a^2+b^2=c^2$. Hint: assume $a, b \in \mathbb{Z}$ are odd and that there does exist such an integer c. Show that $4|(c^2-2)$. Use this together with the previous exercise to derive a contradiction.

9. Identify each of the following statements as true or false (circle "**T**" or "**F**"). **Please explain your answers:** If a statement is true, explain why (you don't need to provide a complete proof; just a sentence or two will do). If a statement is false, provide a counterexample to the statement, and explain why it's a counterexample.

(a) $\forall m \in \mathbb{Z}, \exists n \in \mathbb{Z}\colon m|n.$ **T** **F**

(b) $\exists n \in \mathbb{Z}\colon \forall m \in \mathbb{Z}, m|n.$ **T** **F**

(c) $\exists n \in \mathbb{Z}\colon \forall m \in \mathbb{Z}, n|m.$ **T** **F**

(d) $\forall m \in \mathbb{Z},\ \forall n \in \mathbb{Z},\ \exists k \in \mathbb{Z}\colon (m-n)|k.$ **T** **F**

(e) $\exists k \in \mathbb{Z}\colon \forall m \in \mathbb{Z},\ \forall n \in \mathbb{Z},\ (m-n)|k.$ **T** **F**

(f) $\exists k \in \mathbb{Z}\colon \forall m \in \mathbb{Z},\ \forall n \in \mathbb{Z},\ k|(m-n).$ **T** **F**

(g) $\exists n \in \mathbb{Z}\colon \forall m \in \mathbb{Z},\ \forall k \in \mathbb{Z},\ k|(m-n).$ **T** **F**

(h) $\sim\!\big(\forall m \in \mathbb{Z},\ \exists k \in \mathbb{Z}\colon \forall n \in \mathbb{Z},\ (m-n)|k\big).$ **T** **F**

10. Let F_n be the nth Fibonacci number, defined by

$$F_1 = F_2 = 1, \qquad F_{n+2} = F_{n+1} + F_n \quad (n \geq 1).$$

Use mathematical induction to prove that, for any $n \in \mathbb{N}$, the sum of the first n Fibonacci numbers with *even* index equals $F_{2n+1} - 1$. That is: prove that, $\forall n \in \mathbb{N}$,

$$F_2 + F_4 + F_6 \cdots + F_n = F_{2n+1} - 1.$$

11. Use the principle of mathematical induction to prove that, for any $n \in \mathbb{N}$,

$$1 \cdot 1! + 2 \cdot 2! + 3 \cdot 3! + \cdots + n \cdot n! = (n+1)! - 1.$$

(Hint: $(k+2)(k+1)! = (k+2)!$.) Please clearly identify your base step, induction hypothesis, inductive step, and the conclusion of your proof.

12. Use the principle of mathematical induction to prove that, for any $n \in \mathbb{N}$, the sum of the first n *odd* positive integers is n^2. In other words prove that, $\forall n \in \mathbb{N}$,

$$1 + 3 + 5 + 7 + \cdots + 2n - 1 = n^2.$$

13. Use the principle of mathematical induction to prove that, for any $n \in \mathbb{N}$,

$$1 \cdot 3 + 2 \cdot 4 + 3 \cdot 5 + 4 \cdot 6 + \cdots + n(n+2) = \frac{n(n+1)(2n+7)}{6}.$$

14. Use mathematical induction to prove that, for any $n \in \mathbb{Z}_{\geq 0} = \{0, 1, 2, 3, \ldots\}$,

$$5|(n^5 - n).$$

15. Form the negation of each of the following statements. Your negated statement should not contain the symbol "$\sim$" (or any symbol that means "not" or "negation") in it anywhere. (Don't worry about whether these statements are true or false.) Remark: the negation of $a < b$ is $a \geq b$.

(a) $\forall z \in \mathbb{R}, |25 - 37| < z.$

(b) $\exists y \in \mathbb{R}\colon \forall z \in \mathbb{R}, |25 - y| < z.$

(c) $\sim(\forall x \in \mathbb{R},\ \exists y \in \mathbb{R}\colon \forall z \in \mathbb{R}\colon |x - y| < z).$

(d) $\forall x \in \mathbb{R}, \sim(\exists y \in \mathbb{R} : \sim(\forall z \in \mathbb{R}, |x - y| < z))$.

16. Identify each of the following statements as true or false, by putting a "T" or "F" in the space to the *left* of the statement. Then, in the space to the *right* of the statement, put the *number* of the statement that is the *negation* of the statement in question. For example, if the negation of statement 2 is statement 7, then put a "7" in the space to the right of statement 2.

One of the statements has no negation present, so leave the space to the right of that statement blank.

(Recall that $\mathbb{R}^+$ denotes the set of positive real numbers.)

1. _____ $\forall w \in \mathbb{R}^+, \forall x \in \mathbb{R}, \forall y \in \mathbb{R}, \forall z \in \mathbb{R}^+, w + z \leq x - y$ _____
2. _____ $\exists w \in \mathbb{R}^+, \exists x \in \mathbb{R}, \forall y \in \mathbb{R}, \forall z \in \mathbb{R}^+, w + z \leq x - y$ _____
3. _____ $\exists w \in \mathbb{R}^+, \exists x \in \mathbb{R}, \exists y \in \mathbb{R}, \exists z \in \mathbb{R}^+, x < w + y + z$ _____
4. _____ $\sim(\sim(\forall w \in \mathbb{R}^+, \exists x \in \mathbb{R}, \forall y \in \mathbb{R}, \exists z \in \mathbb{R}^+, x - y < w + z))$ _____
5. _____ $\exists w \in \mathbb{R}^+, \forall x \in \mathbb{R}, \exists y \in \mathbb{R}, \forall z \in \mathbb{R}^+, w + z \leq x - y$ _____
6. _____ $\forall w \in \mathbb{R}^+, \exists x \in \mathbb{R}, \forall y \in \mathbb{R}, \exists z \in \mathbb{R}^+, w + z \leq x - y$ ____
7. _____ $\forall w \in \mathbb{R}^+, \forall x \in \mathbb{R}, \sim(\forall y \in \mathbb{R}, \forall z \in \mathbb{R}^+, w + z \leq x - y)$ _____
8. _____ $\sim(\forall w \in \mathbb{R}^+, \forall x \in \mathbb{R}, \sim(\forall y \in \mathbb{R}, \forall z \in \mathbb{R}^+, x - y < w + z))$ _____
9. _____ $\forall w \in \mathbb{R}^+, \forall x \in \mathbb{R}, \exists y \in \mathbb{R}, \exists z \in \mathbb{R}^+, w + z \leq x - y$ _____

17. (a) Explain, intuitively, why the negation of the statement $P \Rightarrow Q$ is the statement $P \wedge \sim Q$ (meaning "P and not Q").

(b) Negate the statement

$$\forall \varepsilon > 0, \exists \delta > 0 \colon 0 < |x - a| < \delta \Rightarrow |f(x) - L| < \varepsilon.$$

18. Prove that $5^{2n} - 1$ is a multiple of 8 for all $n \in \mathbb{N}$.

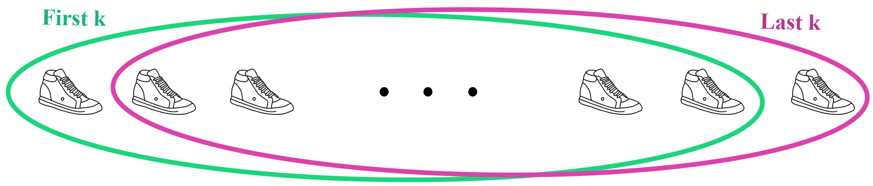
19. What's wrong with the following proof?

Theorem. All sneakers are identical.

Proof. Let $A(n)$ be the statement that all sneakers in any set of n sneakers are identical.

Is $A(1)$ true? Yes, any one sneaker is identical to itself.

Now assume $A(k)$: any k sneakers are identical to each other. To deduce $A(k+1)$, line all $k+1$ sneakers up in a row. The first k sneakers in that row are identical, by the induction hypothesis. So are the last k, by the induction hypothesis. But the second sneaker in the row belongs to both the first k and the last k, so all sneakers are identical to the second one.



So $A(k+1)$ follows. So $A(k) \Rightarrow A(k+1)$. So by induction, $A(n)$ is true for all $n \in \mathbb{N}$.

In particular, let n be the total number of sneakers in existence. Then all of these are identical. $\square$
